## **1. Abstract**

The aim of the study was to analyze healthcare sector from the viewpoint of the planning, implementation and evaluation of the current situation. The purpose was to generate knowledge and implement it in a project that can be utilized in healthcare management.

Every medical practice and every hospital will at some point decide to incorporate a new technology, a new procedure, or a new building; hire a new doctor; or embark on literally hundreds of other projects that require going outside of the box and outside of the usual routine in order to bring the project to perfection. This presentation discusses project management for implementing better medical practice or a hospital management for the betterment of healthcare sector.

The purpose of the study is to assess the financing needs of healthcare infrastructure, and develop management model that identifies problems, a framework for implementation and helps to evaluate dynamically performance of healthcare infrastructure service in India.

Companies like Cigna use data visualization to illustrate an individual's health status compared with others in a similar demographic. Such illustrations can educate patients on areas where they need to improve, including cholesterol levels, body mass index, and exercise habits.

## **2. Introduction**

Economic growth in a country largely depends on the standards of its social infrastructure. Healthcare is important areas of social infrastructure. It also covers care of the other healthcare organization objective of which can be met through healthcare infrastructure needs, management model that identifies problems, develops a framework for implementation and helps to evaluate dynamically healthcare infrastructure service performance and social security measures.

In the past decades there has been a succession of different approaches to the development of infrastructure for the healthcare services. There have been striking similarities among these approaches in both direction-and timing in many different countries, particularly in the developing world.

Through fields such as health data analysis and health informatics, medical organizations accrue large amounts of raw data. Examples of such data include patient diagnosis, outcome and length of stay.

It provides a way to share important findings with stakeholders who may not be data literate, such as hospital executives and administrators. Health data visualization can illuminate the general public and alert them to important developments in a crisis.

Visualizing health data is a powerful way to share urgent health information swiftly and effectively. Health data visualizations are helpful because they condense complex data into more straightforward presentations.

## **The Benefits of Using Data Visualization In Healthcare:**

There are many benefits to using data visualization in health care. Here are a few ways data visualization can increase a hospital's efficiency.

### **Care Coordination**

Simplifying patient care data through data visualization helps nurses interpret research and easily leverage their information. It also allows health care professionals to access the data of other patients with similar symptoms to understand common timelines for recovery.

### **Patient Education**

Companies like Cigna use data visualization to illustrate an individual's health status compared with others in a similar demographic. Such illustrations can educate patients on areas where they need to improve, including cholesterol levels, body mass index, and exercise habits.

### **Public Health**

Data visualizations are often used by the media to depict health-related trends on a large scale. An example could be confirmed COVID-19 cases in the U.S. by state. The visualization might show a graph of the U.S. with shading to illustrate which states have been affected most by the pandemic.

### **Operations**

Operational data can help increase organizational transparency by identifying and measuring specific teams and individuals and gauging their performance against their respective metrics. This can help teams learn from each other, share effective practices, and improve the organization's operational strategy.

## **2.1 Motivation Behind the Project:**

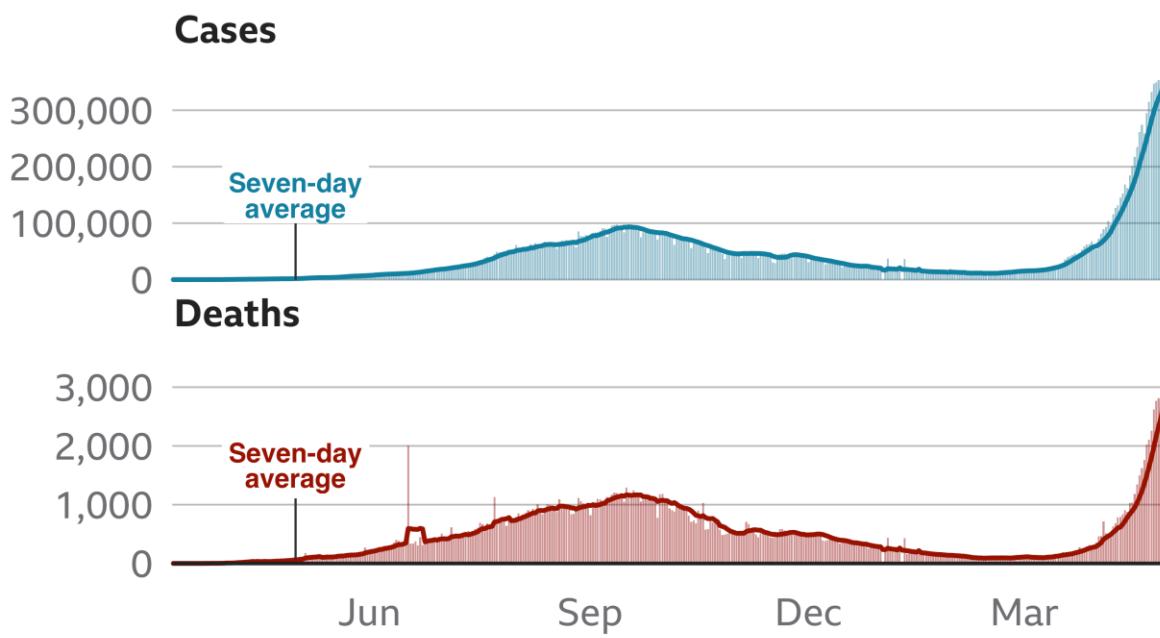

### **COVID-19 CRISIS IN INDIA:**

There have been record numbers of cases and deaths

Case numbers and deaths in India are continuing to rise fast, fuelled by a new variant.

The country recorded the world's highest single-day total on Thursday.

### **Number of daily cases and deaths in India**

Deaths on 17 June include historic deaths reclassified with coronavirus as cause

Source: Johns Hopkins University, data to 29 Apr

BBC

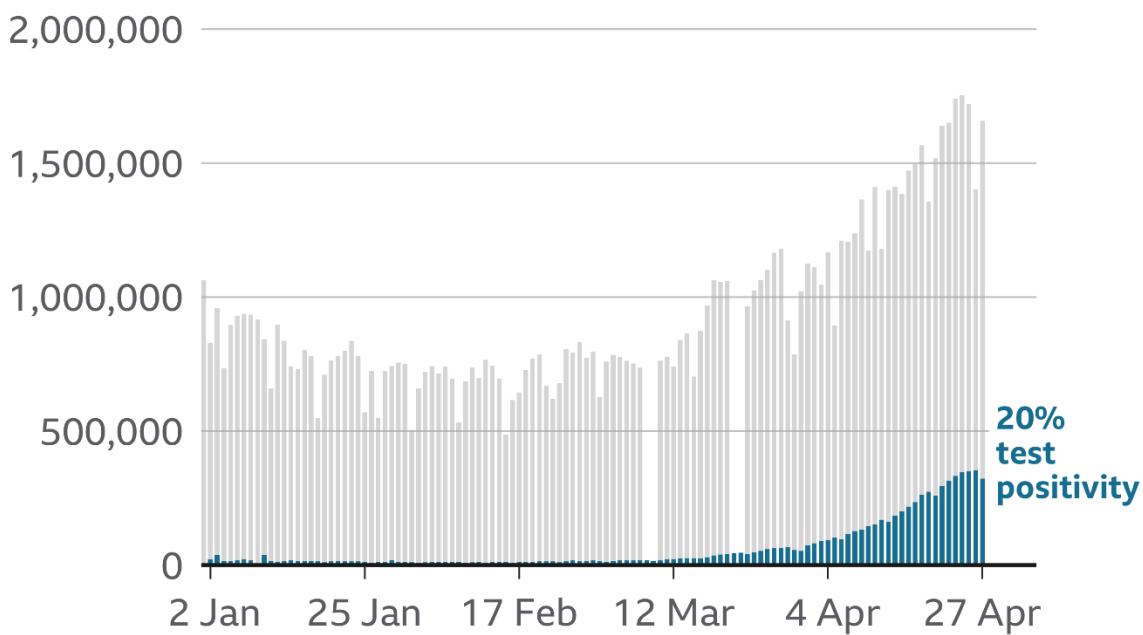

**FIGURE 1**

But the true numbers of cases and deaths are likely to be higher than the numbers provided by authorities, with many people avoiding testing or struggling to access it. Many deaths in rural areas also go unregistered.

Testing is increasing, but so too are the number of positive results.

## More tests are returning positive in India

Tests and confirmed coronavirus cases, by date reported

Source: Our World in Data, Johns Hopkins University, updated 28 Apr

BBC

**FIGURE 2**

Last year, the World Health Organization recommended countries needed to get the positive test rate below 5% for at least two weeks before considering easing restrictions. The rate in India is now around 20%.

A high percentage of positive tests suggests high infection rates and the likelihood of many more people in the community with coronavirus undetected, according to Johns Hopkins University.

In total, India has confirmed more than 18 million infections and 200,000 deaths. Virologists say they expect the rate of infections to continue to increase for another two to three weeks.

- Patients struggle at home as hospitals choke
- Why India is running out of oxygen again
- Countries send urgent aid to India

There are very few critical care beds

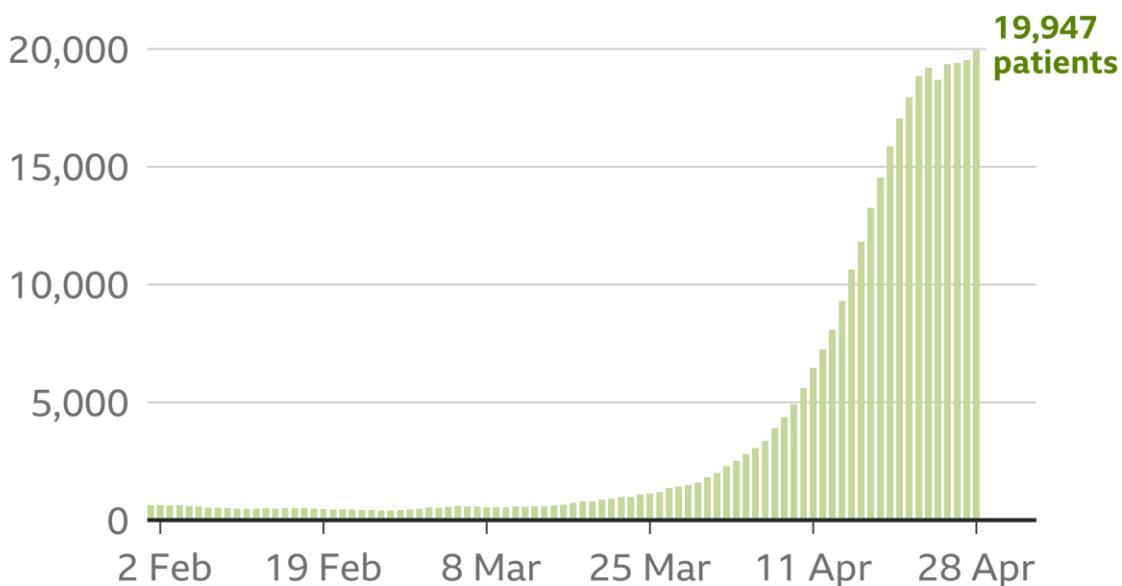

The country has a chronic shortage of space on its intensive care wards, with many patients' families forced to drive for miles to try to find a bed for their loved one.

In Delhi - a region of about 20 million people - hospitals are full and are turning away new patients.

Doctors have described how people are dying on the streets outside hospitals as the country struggles to cope.

## **Numbers of Covid patients have risen sharply**

People in Covid beds in Delhi, by date

Source: Government of Delhi State Health Bulletins

BBC

**FIGURE 3**

Some streets outside medical facilities have become crowded with the seriously ill, their loved ones trying to arrange stretchers and oxygen supplies for them as they plead with hospital authorities for a place inside.

"We have been roaming around for three days searching for a bed," one man told Reuters news agency as his wife sat immobile on the pavement.

**FIGURE 4**

IMAGE COPYRIGHTGETTY IMAGES

On Monday, the government announced military medical infrastructure would be made available to civilians and retired medical military personnel would be helping out in Covid health facilities.

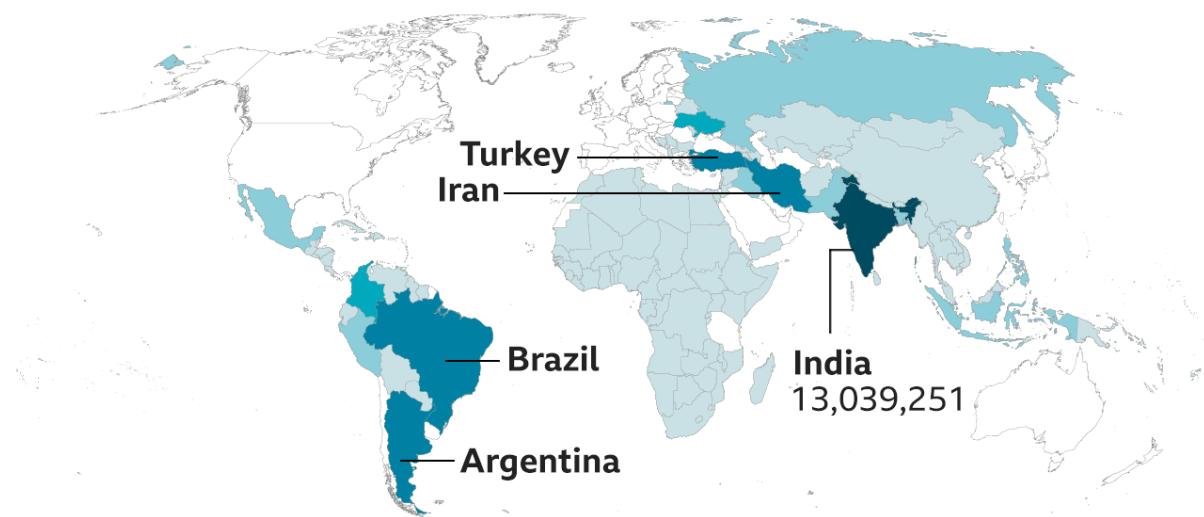

### **There's a shortage of oxygen**

Hospitals across India are also experiencing oxygen shortages, with some forced to put up signs warning of a lack of supplies.

The country now has the greatest demand for oxygen out of all other low, lower-middle and upper-middle-income countries, according to the PATH Oxygen Needs Tracker.

## Daily oxygen needed for Covid-19 patients

### Low, lower-middle and upper-middle-income countries

Cubic metres per day

■ 1-150k ■ 151-500k ■ 501k - 1 million ■ 1-3 million ■ 3-14 million  
□ High income country or no data

### **3. Feasibility Study**

Big data or population-based information has the potential to reduce uncertainty in medicine by informing clinicians about individual patient care. The objectives were: 1) to explore the feasibility of extracting and displaying population-based information from an actual clinical population's database records, 2) to explore specific design features for improving analysis display, 3) to explore perceptions of population information displays, and 4) to explore the impact of population information display on cognitive outcomes.

The qualitative data analysis for preferences of population information display resulted in four themes: 1) trusting the big/population data can be an issue, 2) embedded analytics is necessary to explore patient similarities, 3) need for tools to control the view (overview, zoom and filter), and 4) different presentations of the population display can be beneficial to improve the display.

A population database has great potential for reducing complexity and uncertainty in medicine to improve clinical care. The preferences identified for the population information display will guide future health information technology system designers for better and more intuitive display.

## 4. About the Dataset

Real time datasets were obtained from various reliable sources on the internet:

- Official websites maintained by the Govt.
- Kaggle.com

### Kaggle.com

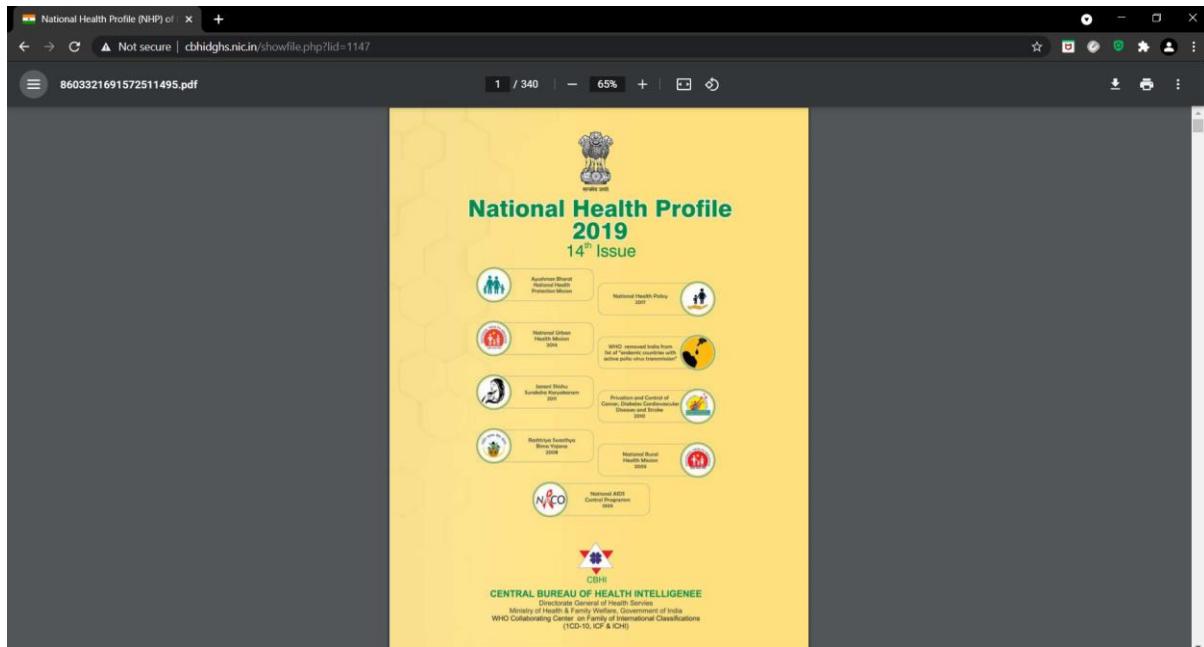

Kaggle, a subsidiary of Google LLC, is an online community of data scientists and machine learning practitioners. Kaggle allows users to find and publish data sets, explore and build models in a web-based data-science environment, work with other data scientists and machine learning engineers, and enter competitions to solve data science challenges.

Kaggle got its start in 2010 by offering machine learning competitions and now also offers a public data platform, a cloud-based workbench for data science, and Artificial Intelligence education. Its key personnel were Anthony Goldbloom and Jeremy Howard. Nicholas Gruen was founding chair succeeded by Max Levchin. Equity was raised in 2011 valuing the company at \$25 million. On 8 March 2017, Google announced that they were acquiring Kaggle.

## **5. Design and Flow of Modules:**

Following are the modules in which we have divided our project:

### **Patient hospital record modules:**

- Patient appointment booking
- Patient medical record check
- Appointment booking System

### **Statistics based modules:**

- Analysis of road accidents in India in the year 2020.
- Analysis of bed availability in hospitals across India during COVID-19 pandemic.
- COVID-19
  - Total cases worldwide
  - Total recovery worldwide
  - Total confirmed cases state wise in India
  - Total deaths state wise in India
- Cancer treatment costs

The above flow list of modules is also followed throughout the project implementation as well as in this project report.

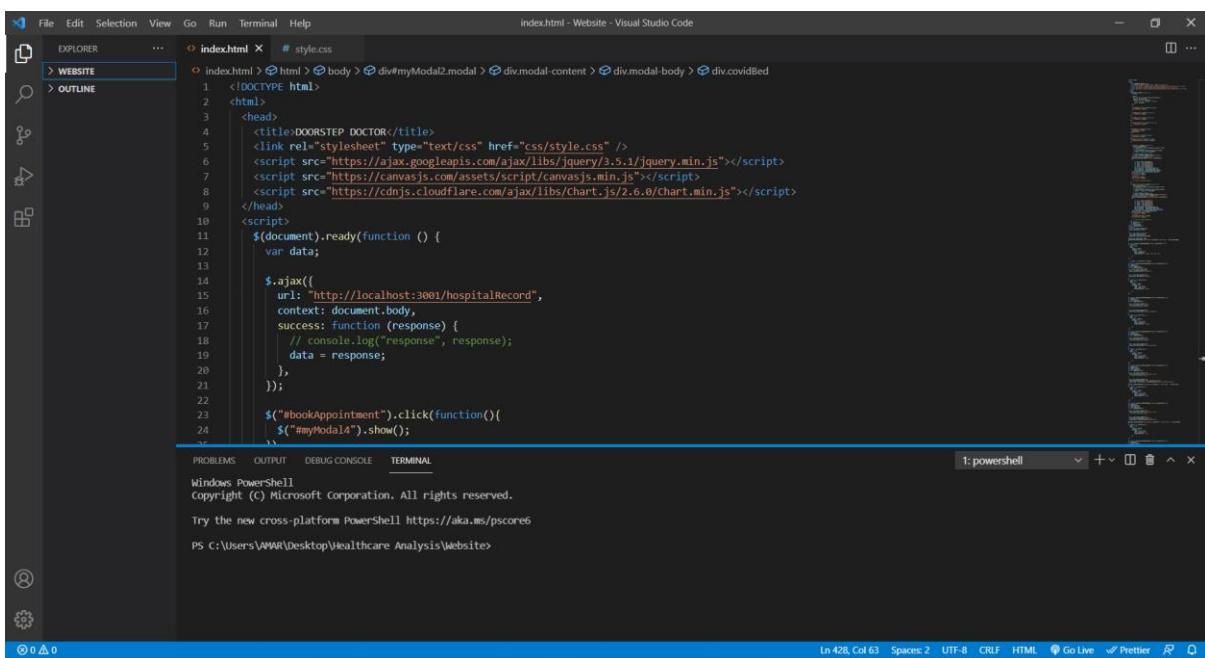

## 6. Module List

- Implementation of basic features through webpage
- Analysis of road accidents in India in the year 2020.
- Analysis of bed availability in hospitals across India during COVID-19 pandemic.
- Patient appointment booking
- Patient medical record check
- Appointment booking System
- COVID-19
  - ❖ Total cases worldwide
  - ❖ Total recovery worldwide
  - ❖ Total confirmed cases state wise in India
  - ❖ Total deaths state wise in India
- Cancer treatment costs

### 6.1 UID and Front-end validations:

#### 6.1.1- Front-end code:

##### HTML and JavaScript Code:

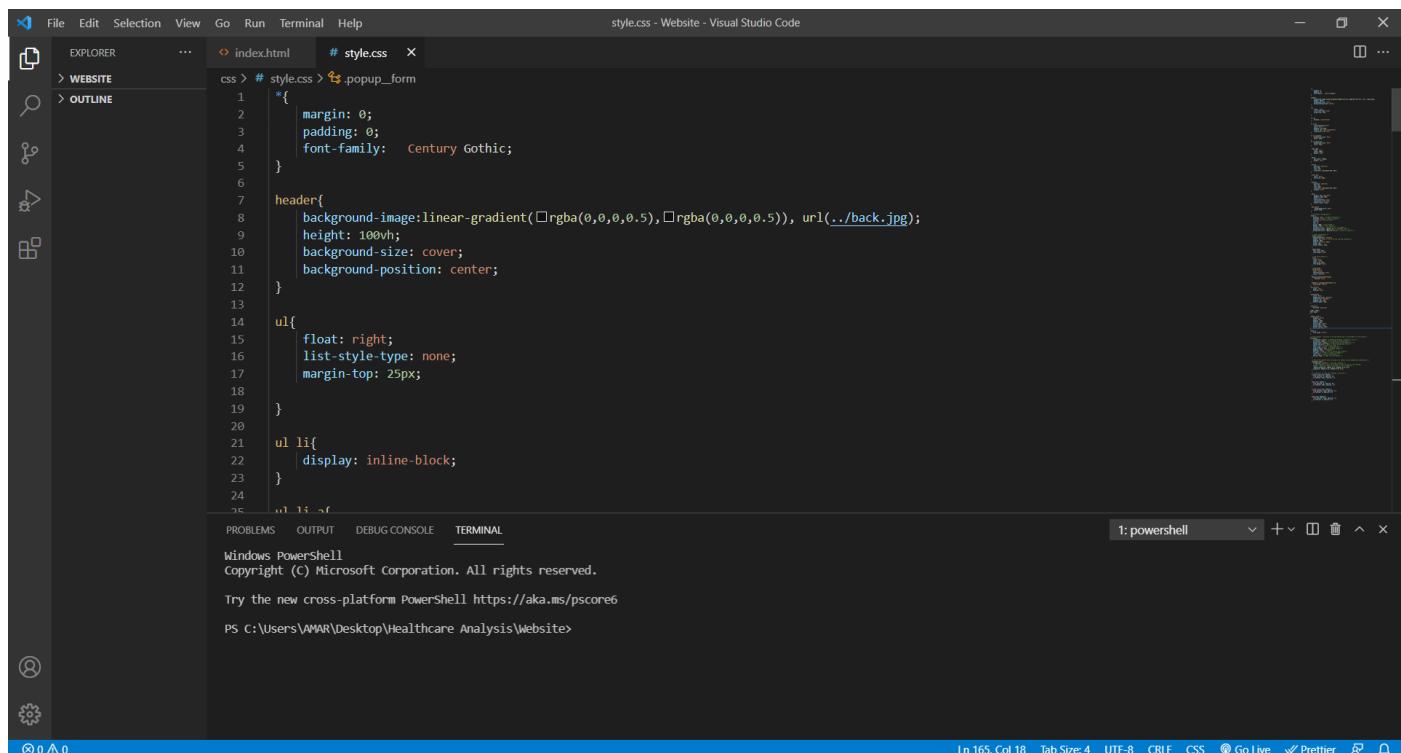

The screenshot shows the Visual Studio Code interface with the 'index.html' file open. The code is as follows:

```
<!DOCTYPE html>
<html>
  <head>
    <title>DOORSTEP DOCTOR</title>
    <link rel="stylesheet" type="text/css" href="css/style.css" />
    <script src="https://ajax.googleapis.com/ajax/libs/jquery/3.5.1/jquery.min.js"></script>
    <script src="https://canvasjs.com/assets/script/canvasjs.min.js"></script>
    <script src="https://cdnjs.cloudflare.com/ajax/libs/Chart.js/2.6.0/Chart.min.js"></script>
  </head>
  <script>
$(document).ready(function () {
  var data;

  $.ajax({
    url: "http://localhost:3001/hospitalRecord",
    context: document.body,
    success: function (response) {
      // console.log("response", response);
      data = response;
    },
  });
  $("#bookAppointment").click(function(){
    $("#myModal4").show();
  });
});
  </script>

```

## CSS Code:

The screenshot shows the Visual Studio Code interface with the following details:

- File Bar:** File, Edit, Selection, View, Go, Run, Terminal, Help.
- Explorer:** Shows a tree view with 'WEBSITE' selected.
- Editor:** The file 'style.css' is open, displaying the following CSS code:

```
css > # style.css > .popup_form
  *{
    margin: 0;
    padding: 0;
    font-family: Century Gothic;
  }

  header{
    background-image: linear-gradient(rgba(0,0,0,0.5), rgba(0,0,0,0.5)), url(..back.jpg);
    height: 100vh;
    background-size: cover;
    background-position: center;
  }

  ul{
    float: right;
    list-style-type: none;
    margin-top: 25px;
  }

  ul li{
    display: inline-block;
  }
```

- Terminal:** Shows a Windows PowerShell session with the following output:

```
Windows PowerShell
Copyright (C) Microsoft Corporation. All rights reserved.

Try the new cross-platform PowerShell https://aka.ms/pscore6

PS C:\Users\AMAR\Desktop\Healthcare Analysis\Website>
```
- Status Bar:** ShowsLn 165, Col 18 Tab Size: 4 UTF-8 CRLF CSS Go Live Prettier

## 6.2 Web-based application:

The name of the Web-based application is “DOORSTEP DOCTOR”.

## **6.3- View your Medical History Module:**

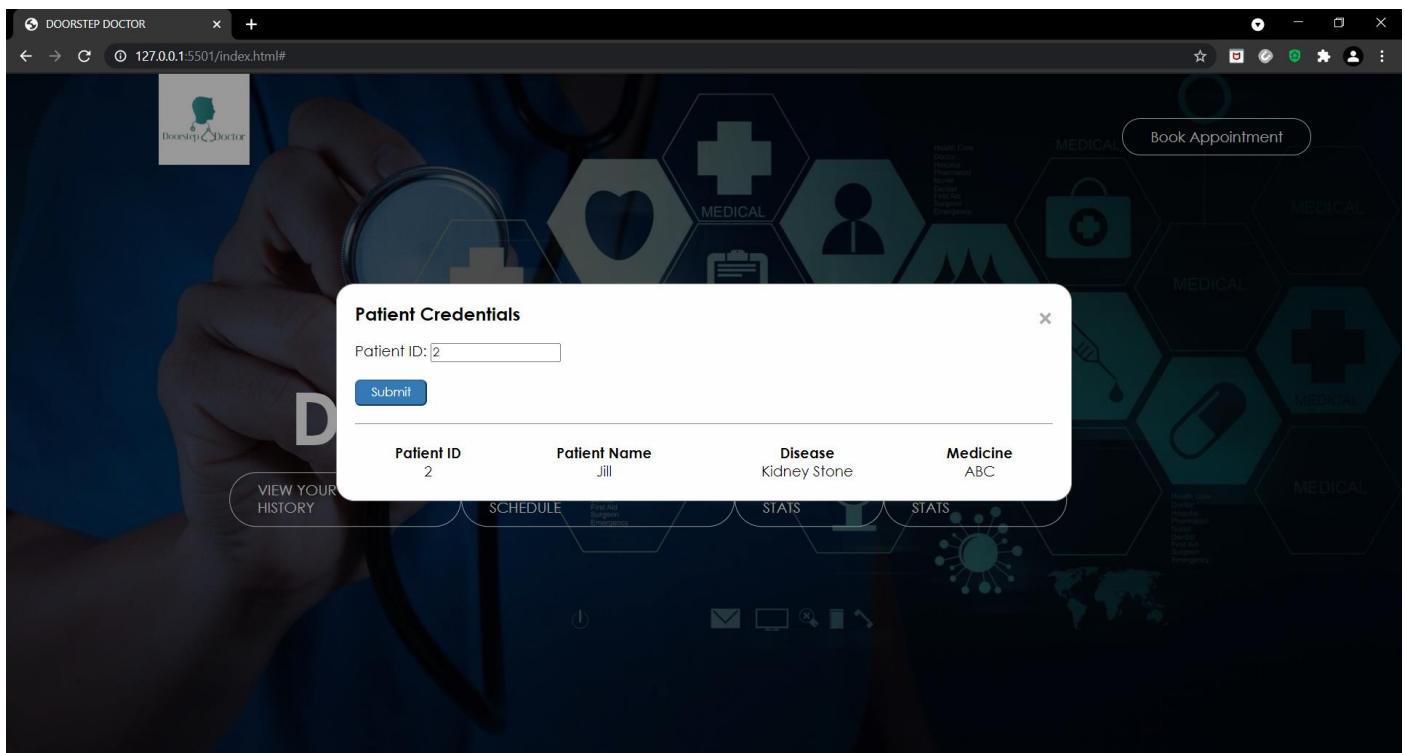

**Code:**

```
<!-- The Medical History Modal -->
<div id="myModal" class="modal">
  <!-- Modal content -->
  <div class="modal-content">
    <div class="modal-head">
      <span class="close">&times;</span>
      <p>Patient Credentials</p>
    </div>
    <br />
    <div class="modal-body">
      <form id="myForm" action="">
        <label for="fname">Patient ID: </label>
        <input type="number" id="fname" name="fname" /><br /><br />
        <input type="submit" value="Submit" class="btnPrimary"/>
      </form>
      <br />
      <hr />
      <br />
      <div id="record">
        <table style="width: 100%" id="myTable">
          <thead>
            <tr>
              <th>Patient ID</th>
              <th>Patient Name</th>
              <th>Disease</th>
              <th>Medicine</th>
            </tr>
          </thead>
        </table>
        <div class="no-record">No Record Found</div>
      </div>
    </div>
  </div>
</div>
```

Patient need to click on **VIEW YOUR MEDICAL HISTORY** button

On entering his **Patient Id**, he/she can view their medical history.

## **6.4- View Appointment Schedule Module:**

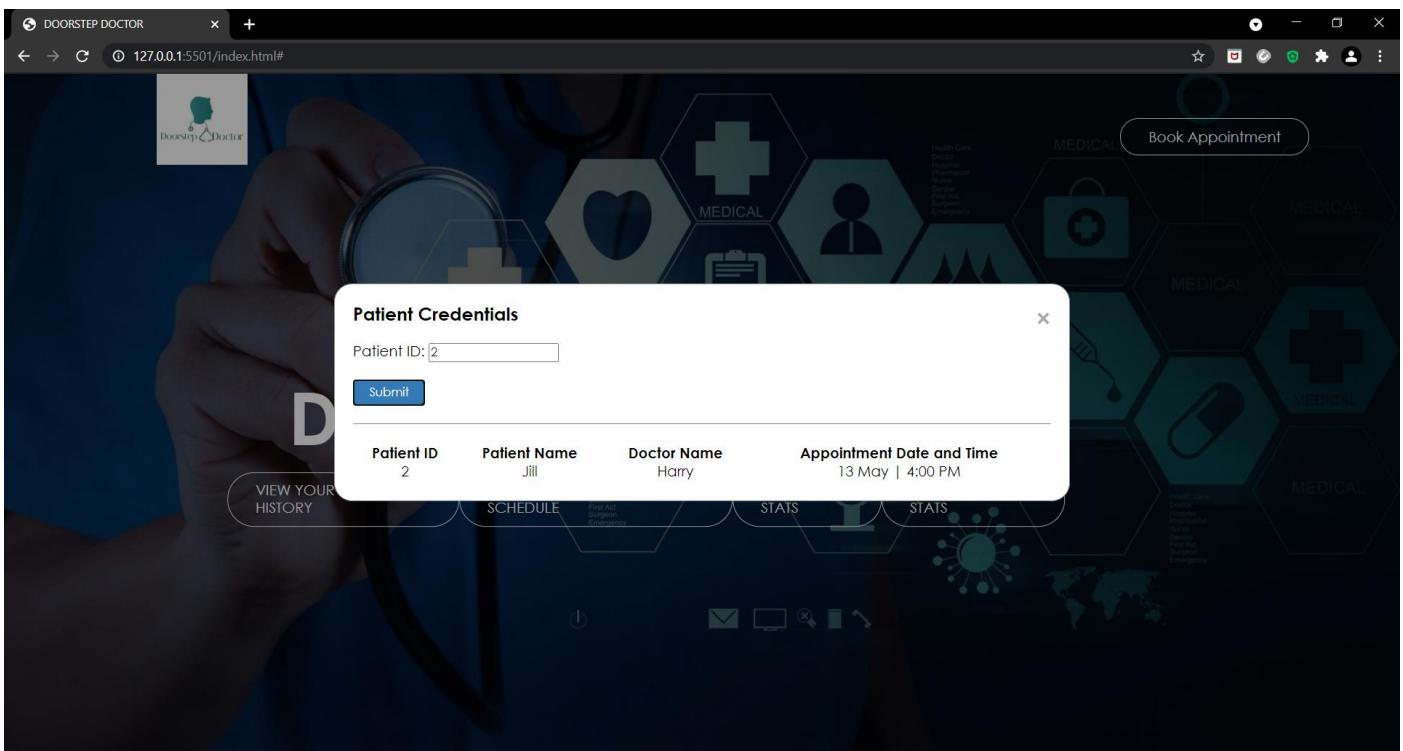

**Code:**

```
<!-- The Appointment History Modal -->
<div id="appointmentHistoryModal" class="modal">
  <!-- Modal content -->
  <div class="modal-content">
    <div class="modal-head">
      <span class="close">&times;</span>
      <p>Patient Credentials</p>
    </div>
    <br />
    <div class="modal-body">
      <form id="appointHistoryForm" action="">
        <label for="fname">Patient ID: </label>
        <input type="number" id="fname" name="fname" /><br /><br />
        <input type="submit" value="Submit" class="btnPrimary" />
      </form>
    <br />
    <hr />
    <br />
    <div id="record">
      <table style="width: 100%" id="appointmentTable">
        <thead>
          <tr>
            <th>Patient ID</th>
            <th>Patient Name</th>
            <th>Doctor Name</th>
            <th>Appointment Date and Time</th>
          </tr>
        </thead>
        </table>
      <div class="no-record">No Record Found</div>
    </div>
  </div>
</div>
```

Patient need to click on **VIEW YOUR APPOINTMENT HISTORY** button

On entering his **Patient Id**, he/she can view their appointment schedule.

## 6.5 Road accidents in India in the year 2020.

### Code:

```
var ctx_2 = document.getElementById("canvas1").getContext('2d');
var labels1=[];
var dataPoints1=[];
function addData1(data) {
    // console.log("data2",data);
for(var i=0;i<data.length;i++){
    labels1.push(data[i]['States/UTs'])
}

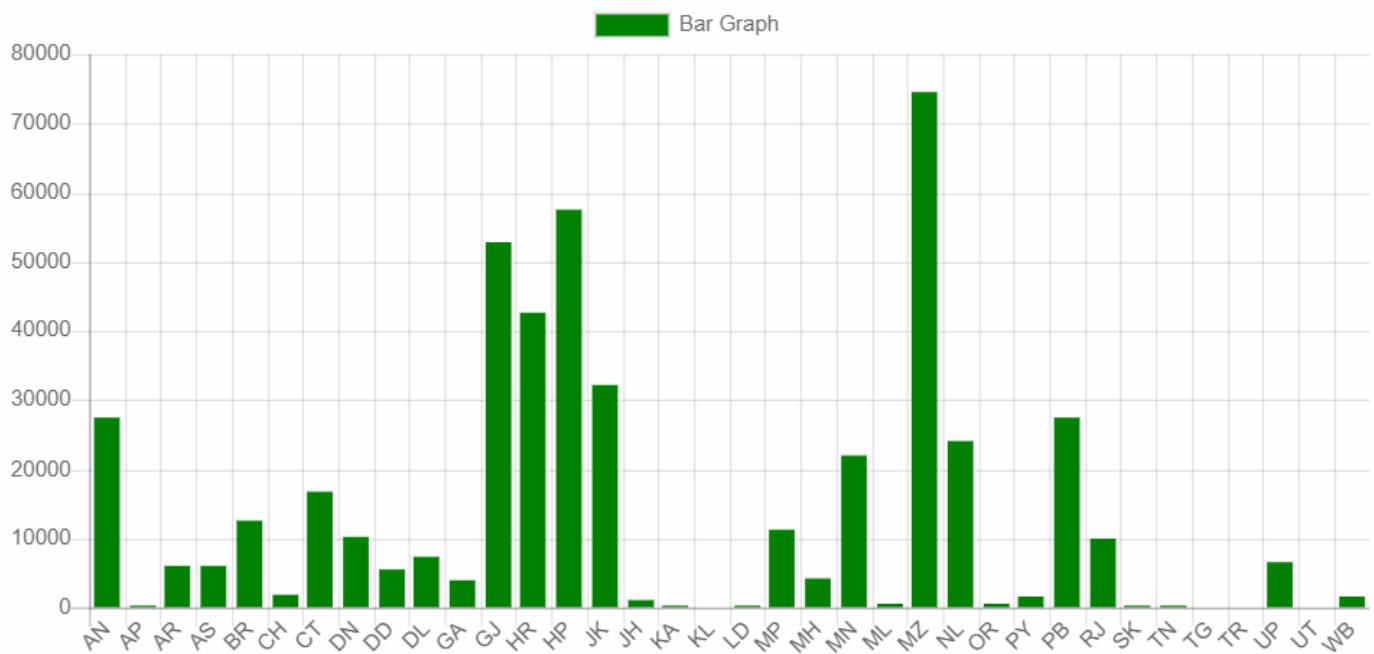

for(var j=0;j<data.length;j++){
    dataPoints1.push(data[j]['2020'])
}
}
var chart1 = new Chart(ctx_2, {
    type: 'bar',
    data: {
        labels: labels1,
        datasets: [{
            label: 'Bar Graph',
            data: dataPoints1,
            backgroundColor: 'green',
        }]
    }
});
```

User has to click on **COUNTRY STATS** button to view country statistics.

## Graph:

Statewise Road Accidents in 2020

## 6.6 Bed availability in hospitals across India during COVID-19 pandemic.

### Code:

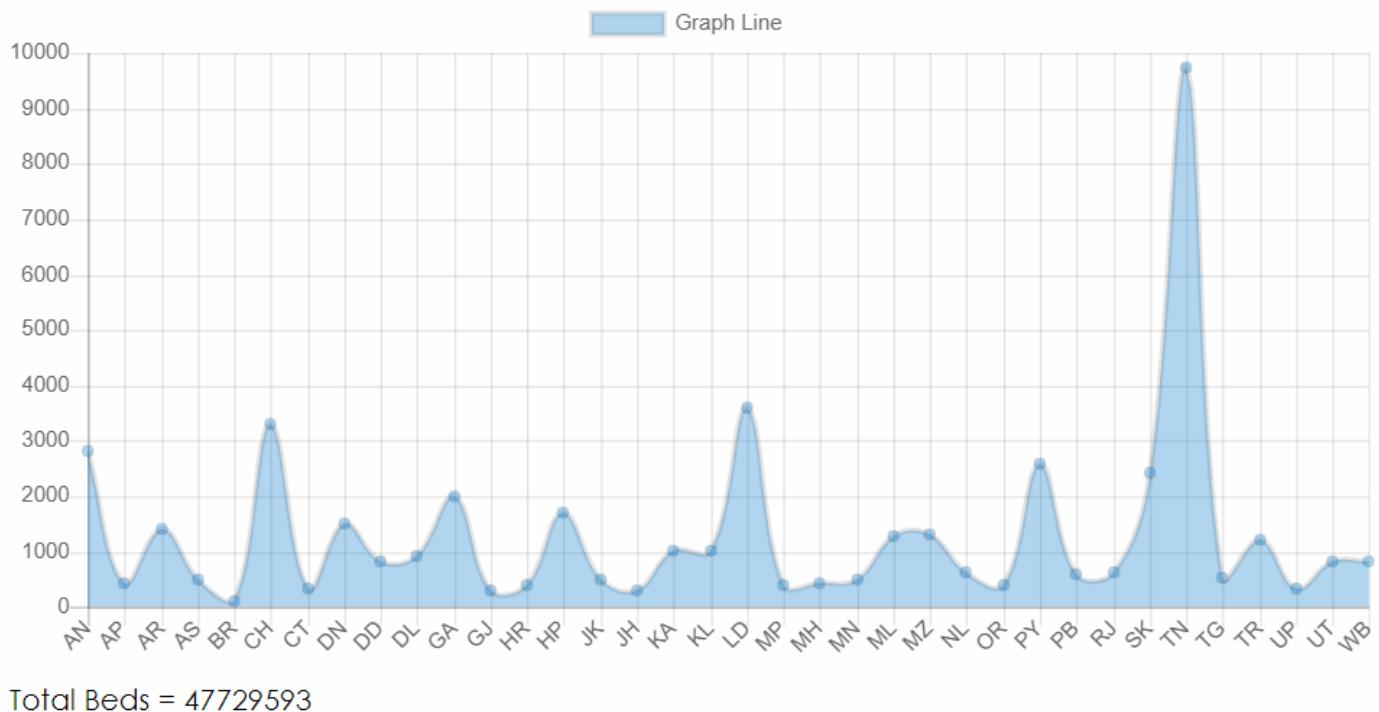

```
var dataPoints = [];
var labels =[];
var total_beds=0;
function addData(data) {
  debugger
  for(var i=0;i<data.length;i++){
    labels.push(data[i].state)
  }

  for(var j=0;j<data.length;j++){
    total_beds +=data[j].beds;
    dataPoints.push(data[j].beds*1000)
  }
  total_beds =total_beds *1000;
  document.getElementById('total_beds').innerText= "Total Beds = "+total_beds*1000;
}

var ctx = document.getElementById("canvas").getContext('2d');
var config = {
  type: 'line',
  data: {
    labels: labels,
    datasets: [{
      label: 'Graph Line',
      data: dataPoints,
      backgroundColor: 'rgba(0, 119, 204, 0.3)',
    }]
  }
};
```

## Graph:

Statewise Covid Beds in India

## 6.7 Total COVID-19 confirmed cases state wise in India

### Code:

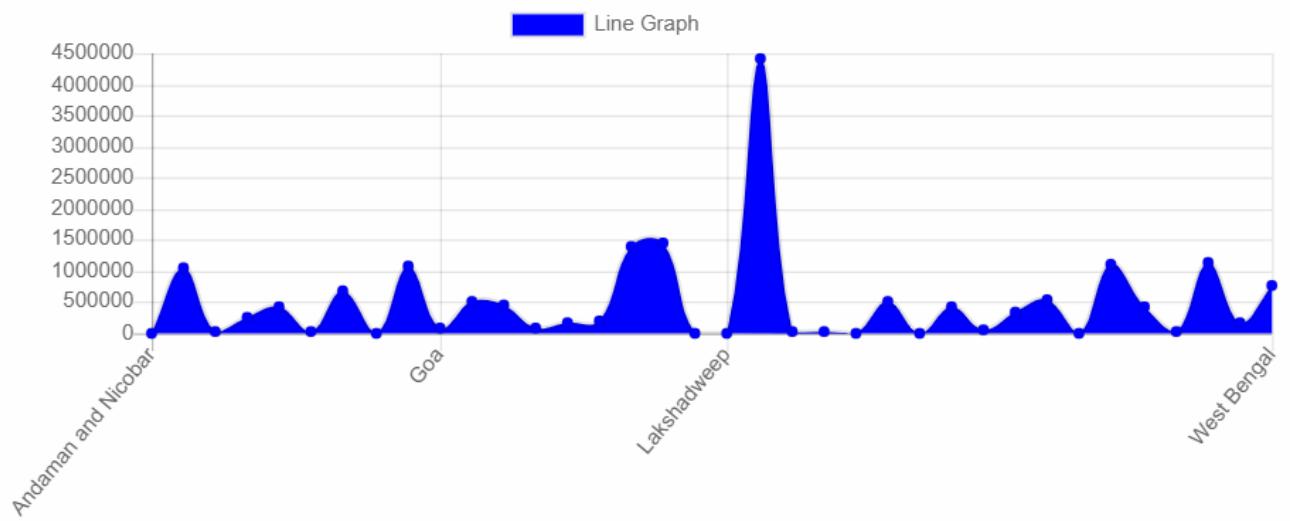

```
var ctx_5 = document.getElementById("canvas4").getContext('2d');
var labels4=[];
var dataPoints4=[];
var total_cases=0;
function addData5(data) {

for(var i=0;i<data.length;i++){
  labels4.push(data[i]["Name of State / UT"])
  // console.log("data32",data);
}

for(var j=0;j<data.length;j++){
  dataPoints4.push(data[j]['Total Confirmed cases'])
  total_cases = total_cases + parseInt(data[j]['Total Confirmed cases']);
}
document.getElementById("total_cases").innerText = 'Total Cases = '+ total_cases;
}
var chart = new Chart(ctx_5, {
  type: 'line',
  data: {
    labels: labels4,
    datasets: [
      {
        label: 'Line Graph',
        data: dataPoints4,
        backgroundColor: 'blue',
      }
    ]
  }
});
```

## Graph:

Total Confirmed Covid cases Statewise

Total Cases = 17997267

## 6.8 Total deaths state wise due to COVID-19 in India

### Code:

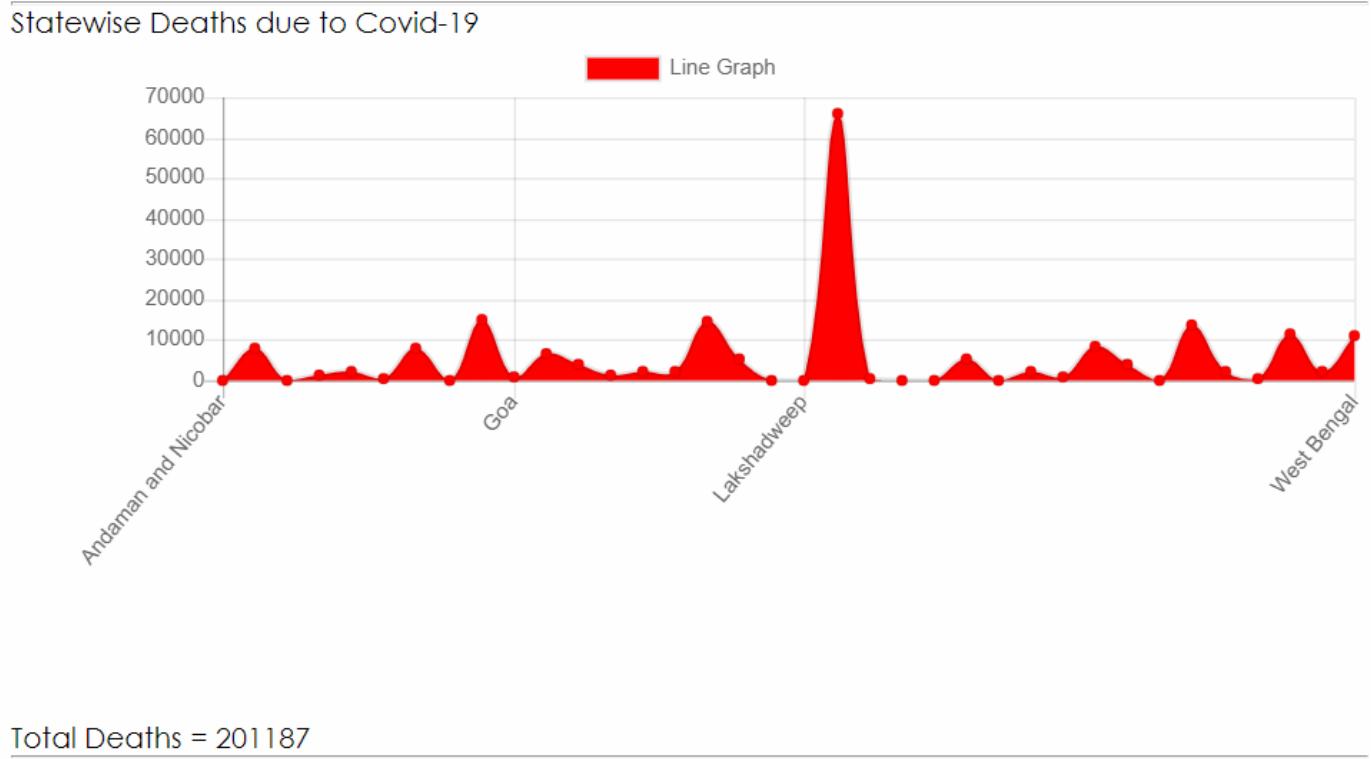

```
var ctx_6 = document.getElementById("canvas5").getContext('2d');
var labels5=[];
var dataPoints5=[];
var total_deaths=0;
function addData6(data) {

for(var i=0;i<data.length;i++){
    labels5.push(data[i]["Name of State / UT"])
    // console.log("data32",data);
}

for(var j=0;j<data.length;j++){
    dataPoints5.push(data[j]["Deaths"])
    total_deaths +=parseInt(data[j]["Deaths"]);
}
document.getElementById("total_deaths").innerText = "Total Deaths = "+ total_deaths;
}

var chart = new Chart(ctx_6, {

## 7. Algorithms Used

### I. Linear Regression:

Regression Analysis is a technique used to estimate the relationship between variables and predict the value of one variable (dependent variable) on the basis of other variables (independent variables).

#### Simple Linear Regression

- It depicts the relationship between a dependent variable and an independent variable.
- It considers one quantitative and independent variable X to predict the other quantitative, but dependent, variable Y.
  - A straight line is fit to the data.

#### Multiple Linear Regression

- It predicts the value of a variable based on the value of two or more other variables.
- It considers more than one quantitative and qualitative variable ( $X_1 \dots X_n$ ) to predict a quantitative and dependent variable Y

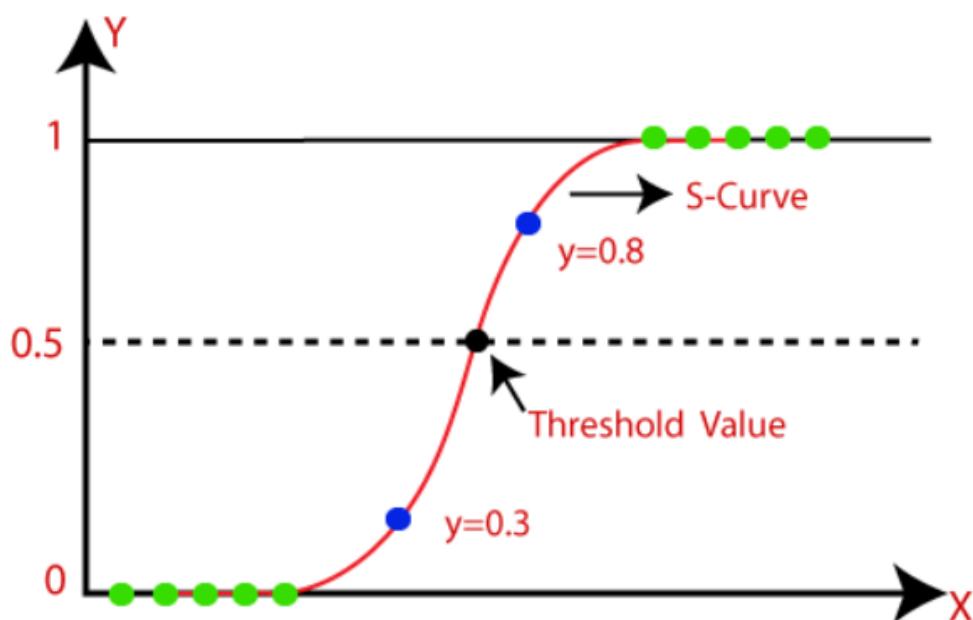

$$y = k + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n$$

The diagram illustrates the components of a multiple linear regression equation. The equation is  $y = k + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_n x_n$ . Arrows point from each term to its corresponding label: 'Dependent Variable' points to  $y$ , 'Coefficient' points to  $\beta_1$ , and 'Predictors' points to  $x_1, x_2, \dots, x_n$ . An arrow also points from the 'Intercept' term to  $k$ .

### II. Logistic Regression:

- Logistic regression is another technique borrowed by machine learning from the field of statistics.

- It is the go-to method for binary classification problems (problems with two class values).
- The logistic function, also called the sigmoid function was developed by statisticians to describe properties of population growth in ecology, rising quickly and maxing out at the carrying capacity of the environment. It's an S-shaped curve that can take any real-valued number and map it into a value between 0 and 1, but never exactly at those limits.

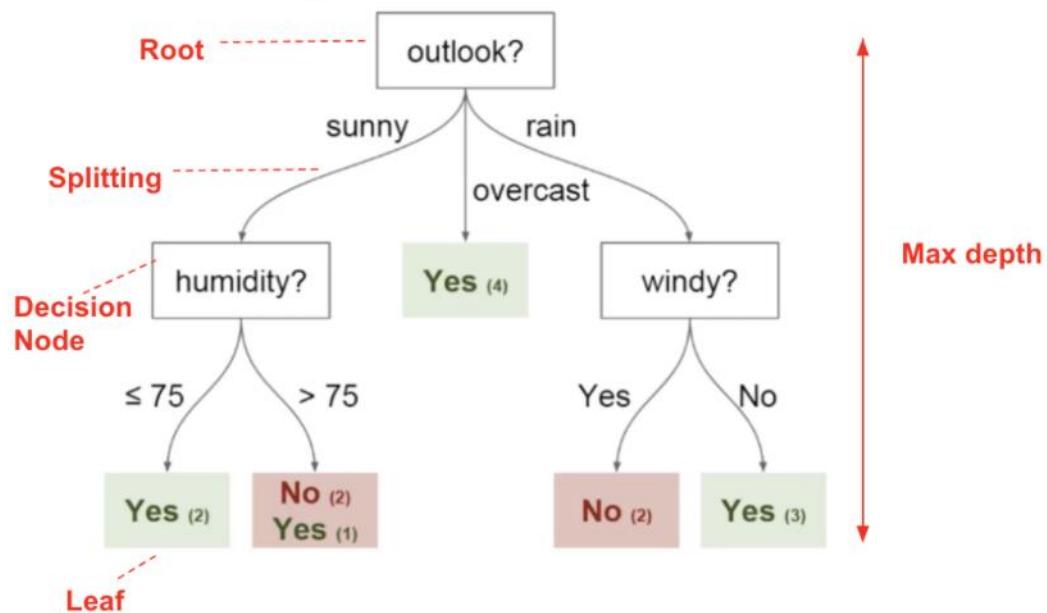

### **III. CART - Classification And Regression Trees:**

- Classification And Regression Trees : Classification and Regression Trees or CART for short is a term introduced by Leo Breiman to refer to Decision Tree algorithms that can be used for classification or regression predictive modeling problems.
- Classically, this algorithm is referred to as “decision trees”, but on some platforms like R they are referred to by the more modern term CART. The CART algorithm

provides a foundation for important algorithms like bagged decision trees, random forest and boosted decision trees. The representation for the CART model is a binary tree.

- This is your binary tree from algorithms and data structures, nothing too fancy. Each root node represents a single input variable ( $x$ ) and a split point on that variable (assuming the variable is numeric). The leaf nodes of the tree contain an output variable ( $y$ ) which is used to make a prediction.

**Decision Tree Diagram**

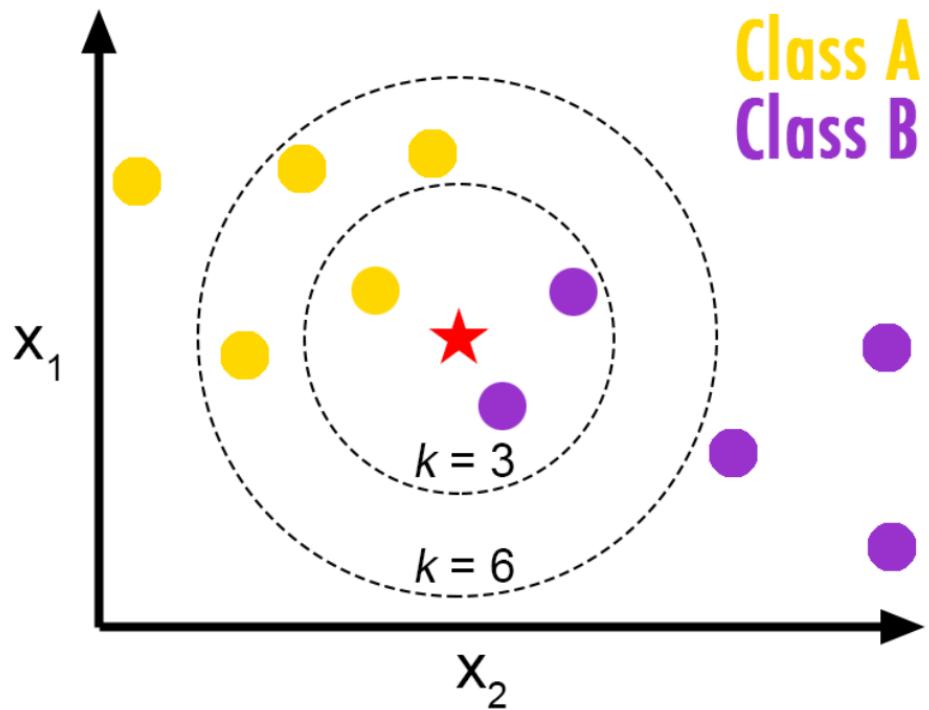

#### IV. KNN – K Nearest Neighbours:

KNN can be used for both classification and regression predictive problems. However, it is more widely used in classification problems in the industry.

The performance of the k-nearest neighbourhoods (k-NN) classifier is highly dependent on the distance metric used to identify the  $k$  nearest neighbours of the query points. The standard Euclidean distance is commonly used in practice.

The k-NN algorithm increases the accuracy of diagnosis. The algorithm can be used to enhance the automated diagnoses, which include diagnosis of multiple diseases showing similar symptoms.

## 8. Risk Analysis

Data visualization is the process of transforming text-heavy data into pictorial or graphical formats like infographics, dials and gauges, geographic maps, spark lines, heat maps, and detailed bar, pie and fever charts. Information comes to life with graphics, making relevant data difficult to overlook. However, if the same information is hidden in mind-blurring columns, rows, cells and text, valuable insights could be lost.

Even the most eye-catching dashboards, charts and graphs equate to “lipstick on a pig” if they reflect incomplete or out-of-date information; if they showcase surface-level or static data; or even if they are difficult to produce.

Another data challenge in healthcare relates to the decentralized nature of the industry. Major systems may be digital, but many organizations and smaller providers are still paper-based. AI and many other technologies can only operate using digital information. This fragmentation of datasets makes it difficult to develop a complete picture of healthcare scenarios.

Privacy restrictions imposed by federal law regulate the release of medical information. Data fragmentation and the lack of uniform digitization impede efficiency, with some data overlooked because it’s stuck in silos. If collecting data violates patients’ expectations for privacy, however, any gains are lost due to noncompliance. Furthermore, if data collection isn’t transparent, individuals are less likely to share the kind of information necessary for protecting society during the next pandemic.

## 9. Implementation

### 9.1 Analysis:

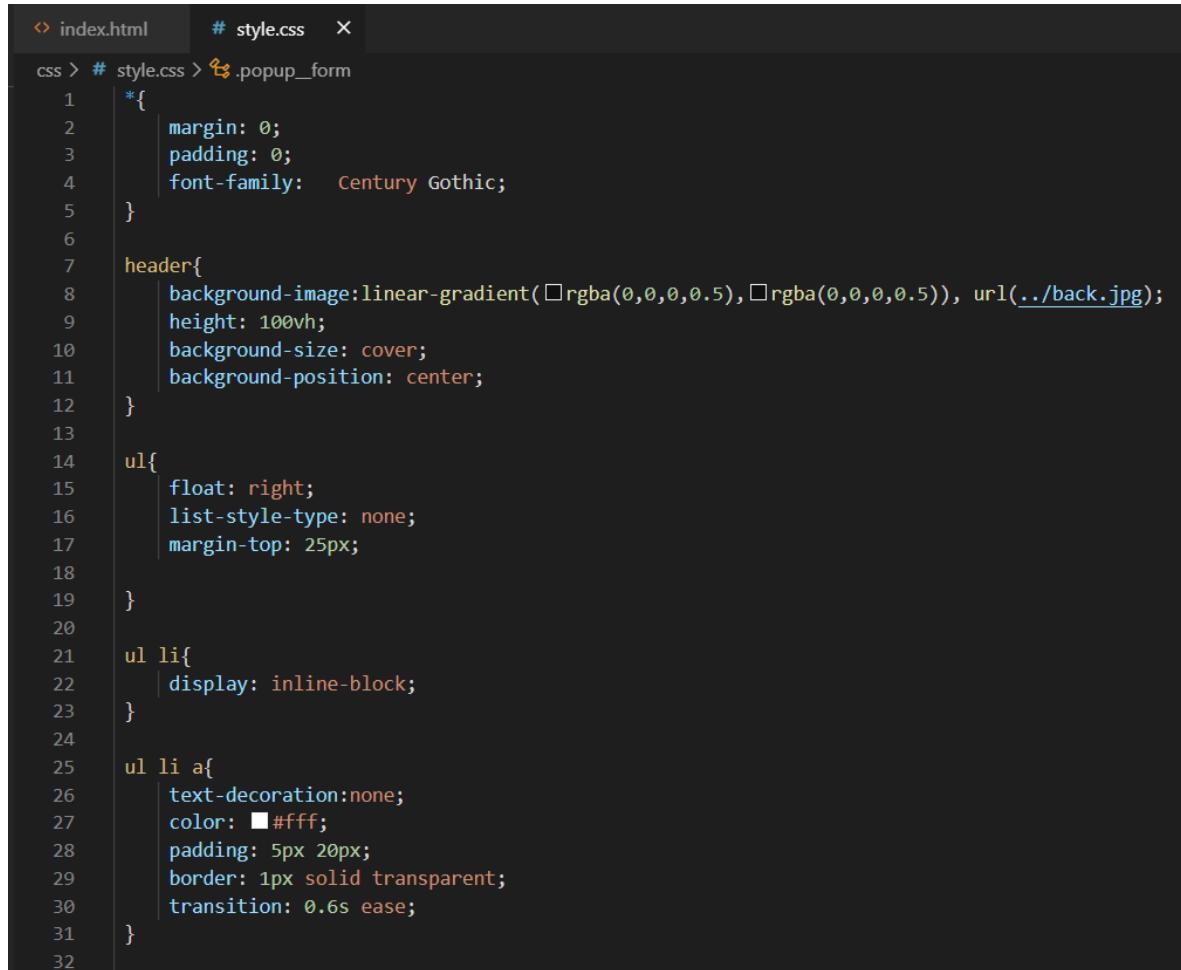

#### 9.1.1- Front-end Implementation:

#### HTML and JavaScript:

```
index.html # style.css
index.html > html > body > div#myModal2.modal > div.modal-content > div.modal-head > span.close
1  <!DOCTYPE html>
2  <html>
3  | <head>
4  | | <title>DOORSTEP DOCTOR</title>
5  | | <link rel="stylesheet" type="text/css" href="css/style.css" />
6  | | <script src="https://ajax.googleapis.com/ajax/libs/jquery/3.5.1/jquery.min.js"></script>
7  | | <script src="https://canvasjs.com/assets/script/canvasjs.min.js"></script>
8  | | <script src="https://cdnjs.cloudflare.com/ajax/libs/Chart.js/2.6.0/Chart.min.js"></script>
9  | | </head>
10 | | <script>
11 | | | $(document).ready(function () {
12 | | | | var data;
13 |
14 | | | $.ajax({
15 | | | | url: "http://localhost:3001/hospitalRecord",
16 | | | | context: document.body,
17 | | | | success: function (response) {
18 | | | | | // console.log("response", response);
19 | | | | | data = response;
20 | | | | },
21 | | | });
22 |
23 | | | $("#bookAppointment").click(function(){
24 | | | | $("#myModal4").show();
25 | | | });
26 |
27 | | | $("#medHistory").click(function () {
28 | | | | $("#myModal").show();
29 | | | });
30 |
31 | | | $("#viewRecords").click(function () {
32 | | | | $("#myModal2").show();
33 | | | });

```

## CSS:

```
index.html # style.css X
css > # style.css > .popup_form
1 *{
2   margin: 0;
3   padding: 0;
4   font-family: Century Gothic;
5 }
6
7 header{
8   background-image: linear-gradient(rgba(0,0,0,0.5), rgba(0,0,0,0.5)), url(..back.jpg);
9   height: 100vh;
10  background-size: cover;
11  background-position: center;
12 }
13
14 ul{
15   float: right;
16   list-style-type: none;
17   margin-top: 25px;
18 }
19
20
21 ul li{
22   display: inline-block;
23 }
24
25 ul li a{
26   text-decoration: none;
27   color: #fff;
28   padding: 5px 20px;
29   border: 1px solid transparent;
30   transition: 0.6s ease;
31 }
32 }
```

### 9.1.2- Back-end Implementation:

**Back-end is designed in JavaScript using NodeJS (Express Module):**

Node.js is an open-source, cross-platform, back-end JavaScript runtime environment that runs on the V8 engine and executes JavaScript code outside a web browser. Node.js lets developers use JavaScript to write command line tools and for server-side scripting—running scripts server-side to produce dynamic web page content before the page is sent to the user's web browser. Consequently, Node.js represents a "JavaScript everywhere" paradigm,[6] unifying web-application development around a single programming language, rather than different languages for server-side and client-side scripts.

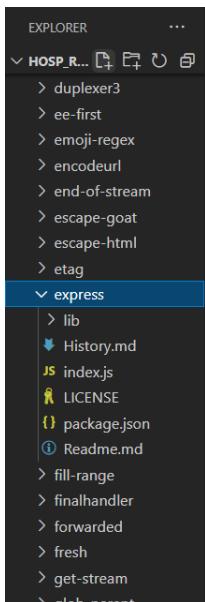

```

JS app.js    X package-lock.json
JS app.js > ...
1 const express = require('express')
2 const MongoClient = require("mongodb").MongoClient;
3
4 const cors=require('cors');
5
6
7 const CONNECTION_URL ='mongodb://localhost:27017/' ;
8 const DATABASE_NAME = "hospRecord";
9
10 const app = express()
11 const port = 3001
12
13 app.use(cors());
14
15 var database, collection;
16
17 < app.get("/hospitalRecord", (request, response) => {
18   < collection.find({}).toArray((error, result) => {
19     < if(error) {
20       | return response.status(500).send(error);
21     }
22     | response.send(result);
23   });
24 });
25
26
27
28 < app.listen(port, () => {
29   < MongoClient.connect(CONNECTION_URL, { useNewUrlParser: true }, (error, client) => {
30     < if(error) {
31       | throw error;
32     }
33     | database = client.db(DATABASE_NAME);

```

## NodeJS modules (Express Module is used):

Express is a minimal and flexible Node.js web application framework that provides a robust set of features for web and mobile applications

### **9.1.3- Database:**

**Database with name as “hospRecord” is created in MongoDB:**

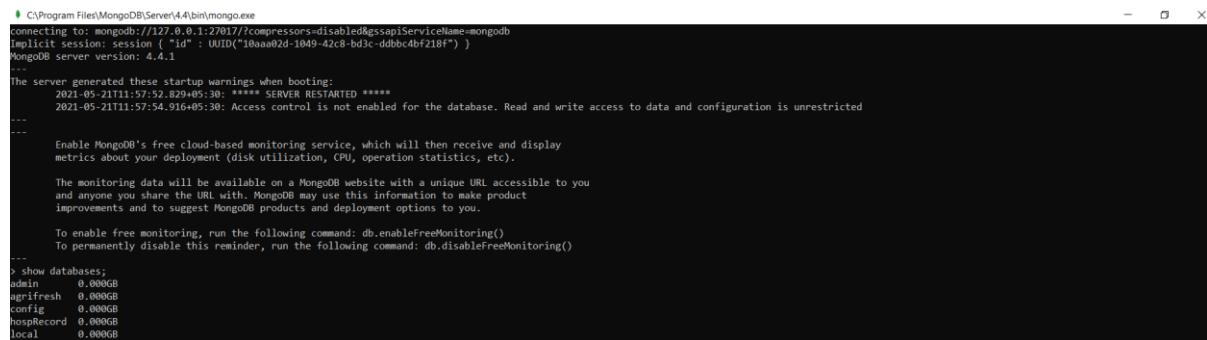

#### **Information about MongoDB:**

**MongoDB is a cross-platform document-oriented database program. Classified as a NoSQL database program, MongoDB uses JSON-like documents with optional schemas. MongoDB is developed by MongoDB Inc. and licensed under the Server Side Public License (SSPL).**

#### **Mongo Server:**

```
C:\Program Files\MongoDB\Server\4.4\bin>mongod.exe
{"t":1,"$date":"2020-11-02T23:23:45.845+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339625:845031][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY_PROGRESS] Recovering log 19 through 20"}, "err":0}, {"t":2,"$date":"2020-11-02T23:23:45.922+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339625:922158][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY_PROGRESS] Recovering log 19 through 20"}, "err":0}, {"t":3,"$date":"2020-11-02T23:23:45.999+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339625:998870][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY_PROGRESS] Main recovery loop: starting at 19/66672 to 20/256"}, "err":0}, {"t":4,"$date":"2020-11-02T23:23:46.117+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339626:117642][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY_PROGRESS] Recovering log 19 through 20"}, "err":0}, {"t":5,"$date":"2020-11-02T23:23:46.196+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339626:195871][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY_PROGRESS] Recovering log 19 through 20"}, "err":0}, {"t":6,"$date":"2020-11-02T23:23:46.266+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339626:265833][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY_PROGRESS] Set global recovery timestamp: (0, 0)"}, "err":0}, {"t":7,"$date":"2020-11-02T23:23:46.266+05:30","s":"I","c":"STORAGE","id":22430,"ctx":"initandlisten","msg":"WiredTiger message","attr":{"message": "[1604339626:265833][18256:140718443224736], txn-recover: [WT_VERB_RECOVERY | WT_VERB_RECOVERY_PROGRESS] Set global oldest timestamp (0, 0)"}, "err":0}, {"t":8,"$date":"2020-11-02T23:23:46.279+05:30","s":"I","c":"STORAGE","id":4795906,"ctx":"initandlisten","msg":"WiredTiger opened","attr":{"durationMillis":4770}}, {"t":9,"$date":"2020-11-02T23:23:46.280+05:30","s":"I","c":"RECOVERY","id":23987,"ctx":"initandlisten","msg":"WiredTiger recoveryTimestamp","attr":{"recoveryTimestamp": "$timestamp": {"t":0, "i":0}}}, {"t":10,"$date":"2020-11-02T23:23:46.296+05:30","s":"I","c":"STORAGE","id":22262,"ctx":"initandlisten","msg":"Timestamp monitor starting"}, {"t":11,"$date":"2020-11-02T23:23:46.302+05:30","s":"I","c":"CONTROL","id":22120,"ctx":"initandlisten","msg":"Access control is not enabled for the database. ```

## Showing “hospRecord” database:

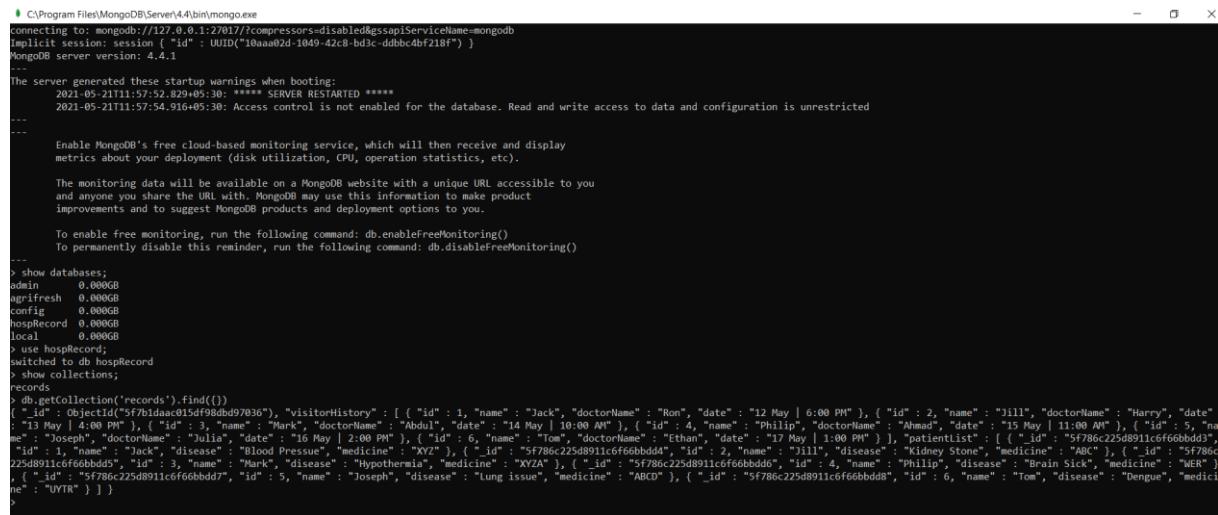

```
C:\Program Files\MongoDB\Server\4.4\bin\mongo.exe
Connecting to: mongodb://127.0.0.1:27017/?compressors=disabled&gssapiServiceName=mongodb
Implicit session: session { "id" : UUID("10aaa02d-1049-42c8-bd3c-ddbbc4bf218f") }
MongoDB server version: 4.4.1
...
The server generated these startup warnings when booting:
2021-05-21T11:57:52.829+05:30: **** SERVER RESTARTED *****
2021-05-21T11:57:54.916+05:30: Access control is not enabled for the database. Read and write access to data and configuration is unrestricted
...
Enable MongoDB's free cloud-based monitoring service, which will then receive and display
metrics about your deployment (disk utilization, CPU, operation statistics, etc).

The monitoring data will be available on a MongoDB website with a unique URL accessible to you
and anyone you share the URL with. MongoDB may use this information to make product
improvements and to suggest MongoDB products and deployment options to you.

To enable free monitoring, run the following command: db.enableFreeMonitoring()
To permanently disable this reminder, run the following command: db.disableFreeMonitoring()
...
> show databases;
admin      0.000GB
agrifresh  0.000GB
config     0.000GB
hospRecord 0.000GB
local      0.000GB
```

Inside the database “hospRecord” a collection called “records” is created:

```
C:\Program Files\MongoDB\Server\4.4\bin\mongo.exe
Connecting to: mongodb://127.0.0.1:27017/?compressors=disabled&gssapiServiceName=mongodb
Implicit session: session { "id" : UUID("10aaa02d-1049-42c8-bd3c-ddbbc4bf218f") }
MongoDB server version: 4.4.1
...
The server generated these startup warnings when booting:
2021-05-21T11:57:52.829+05:30: **** SERVER RESTARTED *****
2021-05-21T11:57:54.916+05:30: Access control is not enabled for the database. Read and write access to data and configuration is unrestricted
...
Enable MongoDB's free cloud-based monitoring service, which will then receive and display
metrics about your deployment (disk utilization, CPU, operation statistics, etc).

The monitoring data will be available on a MongoDB website with a unique URL accessible to you
and anyone you share the URL with. MongoDB may use this information to make product
improvements and to suggest MongoDB products and deployment options to you.

To enable free monitoring, run the following command: db.enableFreeMonitoring()
To permanently disable this reminder, run the following command: db.disableFreeMonitoring()
...
> show databases;
admin      0.000GB
agrifresh  0.000GB
config     0.000GB
hospRecord 0.000GB
local      0.000GB
> use hospRecord;
switched to db hospRecord
> show collections;
records
> db.getCollection('records').find({})
[{"_id": ObjectId("5f786c25d8911c6f66bbdd3"), "visitorHistory": [{"id": 1, "name": "Jack", "doctorName": "Ron", "date": "12 May | 6:00 PM"}, {"id": 2, "name": "Jill", "doctorName": "Harry", "date": "13 May | 4:00 PM"}, {"id": 3, "name": "Mark", "doctorName": "Abdul", "date": "14 May | 10:00 AM"}, {"id": 4, "name": "Philip", "doctorName": "Ahmed", "date": "15 May | 11:00 AM"}, {"id": 5, "name": "Joseph", "doctorName": "Julia", "date": "16 May | 2:00 PM"}, {"id": 6, "name": "Tom", "doctorName": "Ethan", "date": "17 May | 1:00 PM"}], "patientList": [{"id": "5f786c225d8911c6f66bbdd4", "name": "Jack", "disease": "Blood Pressure", "medicine": "XYZA"}, {"id": "5f786c225d8911c6f66bbdd4", "name": "Jill", "disease": "Kidney Stone", "medicine": "ABC"}, {"id": "5f786c225d8911c6f66bbdd5", "name": "Mark", "disease": "Hypothermia", "medicine": "XYZA"}, {"id": "5f786c225d8911c6f66bbdd6", "name": "Philip", "disease": "Brain Sick", "medicine": "WER"}, {"id": "5f786c225d8911c6f66bbdd7", "name": "Joseph", "disease": "Lung issue", "medicine": "ABCD"}, {"id": "5f786c225d8911c6f66bbdd8", "name": "Tom", "disease": "Dengue", "medicine": "UVTR"}]}
```

The collection “record” is made using JSON (JavaScript Object Notation):

## Information about JSON:

JavaScript Object Notation is an open standard file format, and data interchange format, that uses human-readable text to store and transmit data objects consisting of attribute-value pairs and array data types (or any other serializable value). It is a very common data format, with a diverse range of applications, such as serving as a replacement for XML in AJAX systems.

JSON is a language-independent data format. It was derived from JavaScript, but many modern programming languages include code to generate and parse JSON-format data. The official Internet media type for JSON is application/json. JSON filenames use the extension .json.

Douglas Crockford originally specified the JSON format in the early 2000s. JSON was first standardized in 2013, as ECMA-404. RFC 8259, published in 2017, is the current version of

the Internet Standard STD 90, and it remains consistent with ECMA-404. That same year, JSON was also standardized as ISO/IEC 21778:2017. The ECMA and ISO standards describe only the allowed syntax, whereas the RFC covers some security and interoperability considerations.

## 9.2 Visualization

### 9.2.1 Description

**For visualization purpose we have used Chart.js and HTML5 Canvas.**

#### HTML5 Canvas:

**The HTML <canvas> element is used to draw graphics on a web page.**

The graphic to the left is created with <canvas>. It shows four elements: a red rectangle, a gradient rectangle, a multicolour rectangle, and a multicolour text.

#### **What is HTML Canvas?**

The HTML <canvas> element is used to draw graphics, on the fly, via JavaScript. The <canvas> element is only a container for graphics. You must use JavaScript to actually draw the graphics. Canvas has several methods for drawing paths, boxes, circles, text, and adding images.

#### Chart.js:

Chart.js is a free open-source JavaScript library for data visualization, which supports 8 chart types: bar, line, area, pie (doughnut), bubble, radar, polar, and scatter. Created by London-based web developer Nick Downie in 2013, now it is maintained by the community and is the second most popular JS charting library on GitHub by the number of stars after D3.js, considered significantly easier to use though less customizable than the latter. Chart.js renders in HTML5 canvas and is widely covered as one of the best data visualization libraries. It is available under the MIT license.

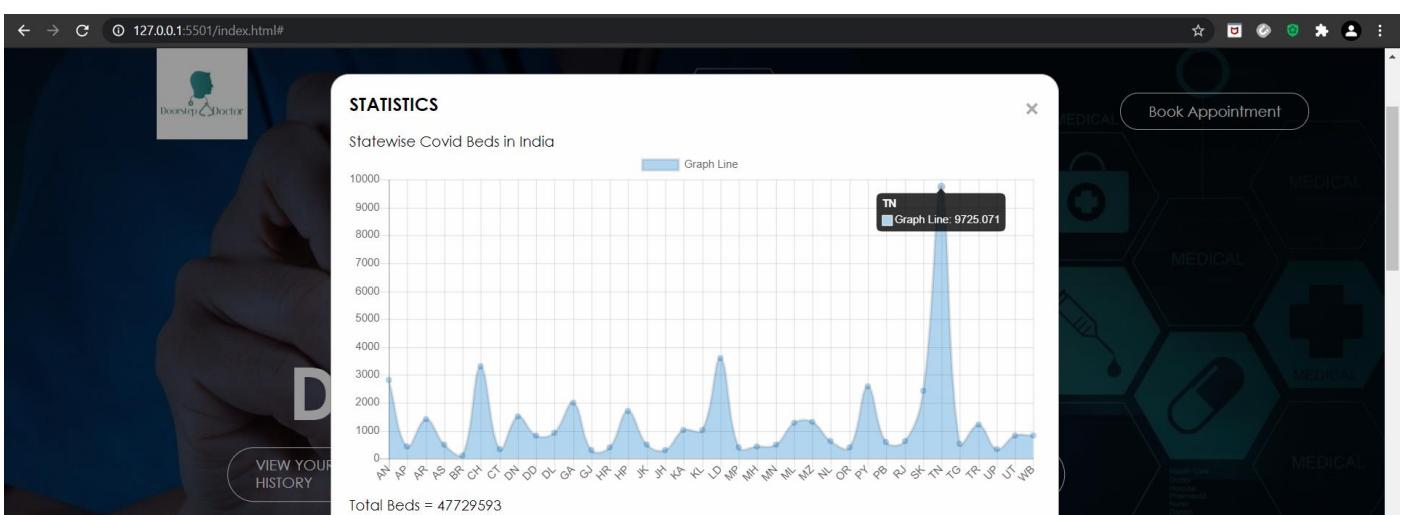

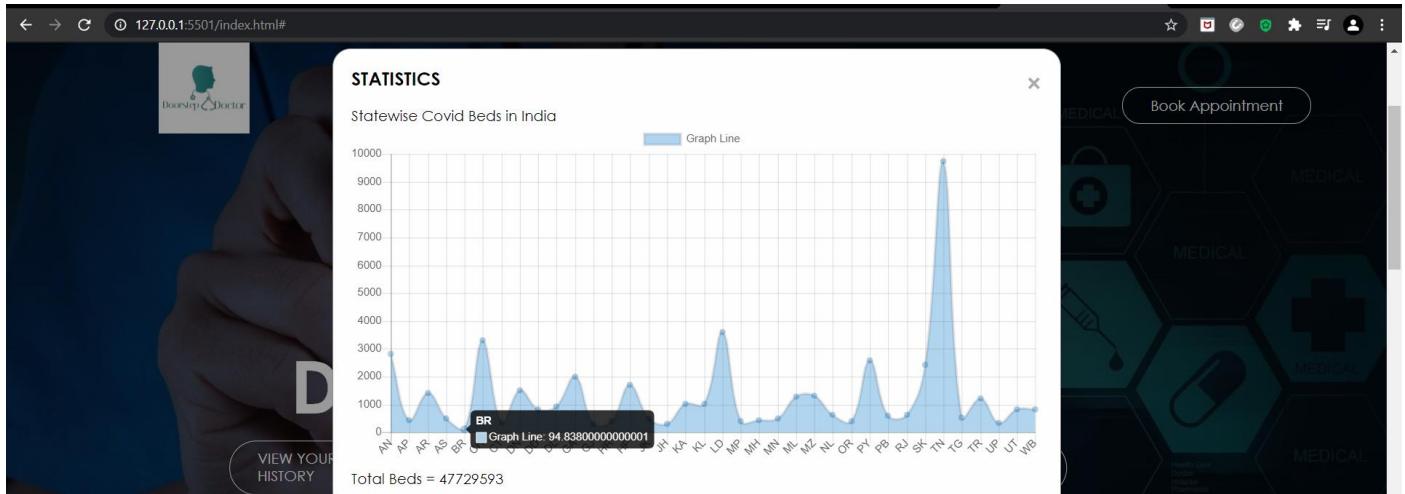

## 9.2.2 Graphs

Under country stats we have plotted 5 graphs related to our Country data:

### 9.2.2.1 State-wise COVID-19 beds in India:

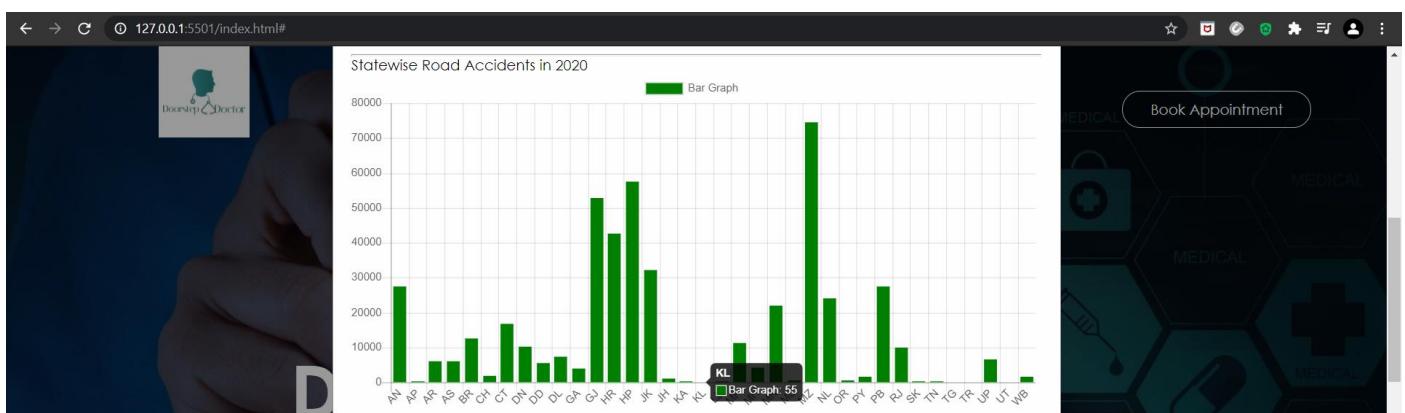

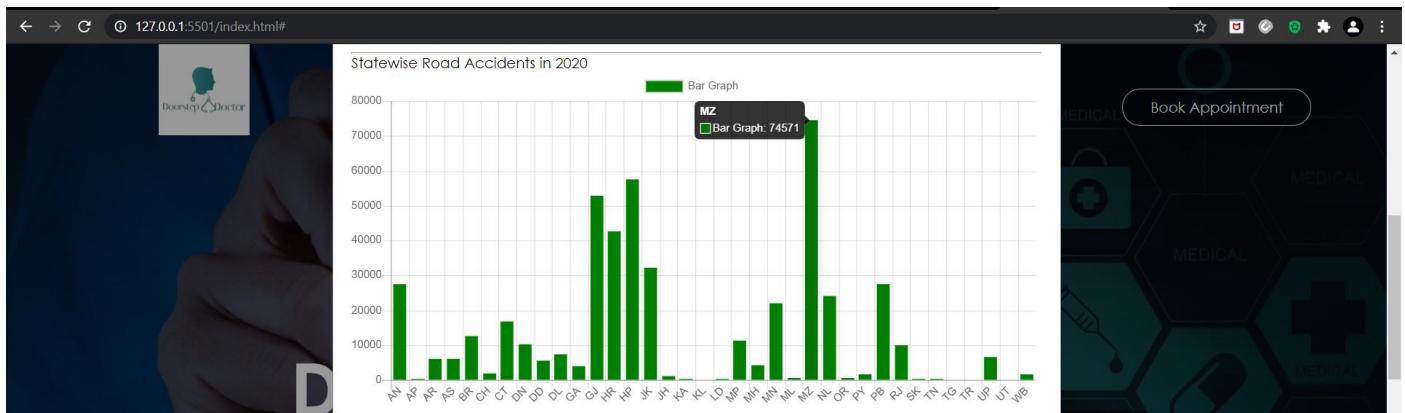

Conclusion from graphs:

- The graph shows total beds in the country.
- State/UT with highest number of beds is Tamil Nadu.
- State/UT with lowest number of beds is Bihar.

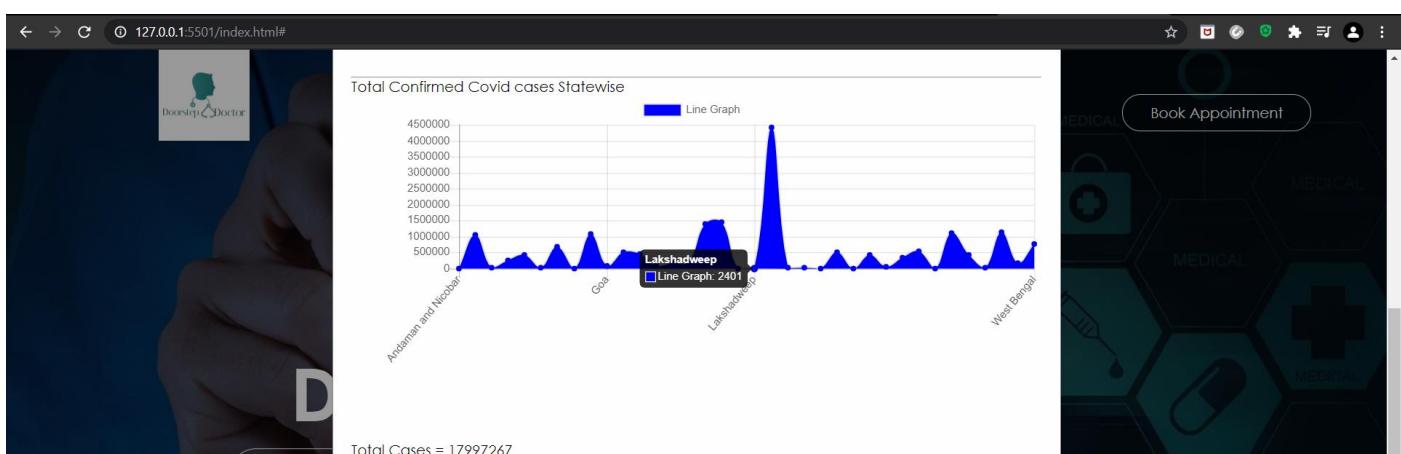

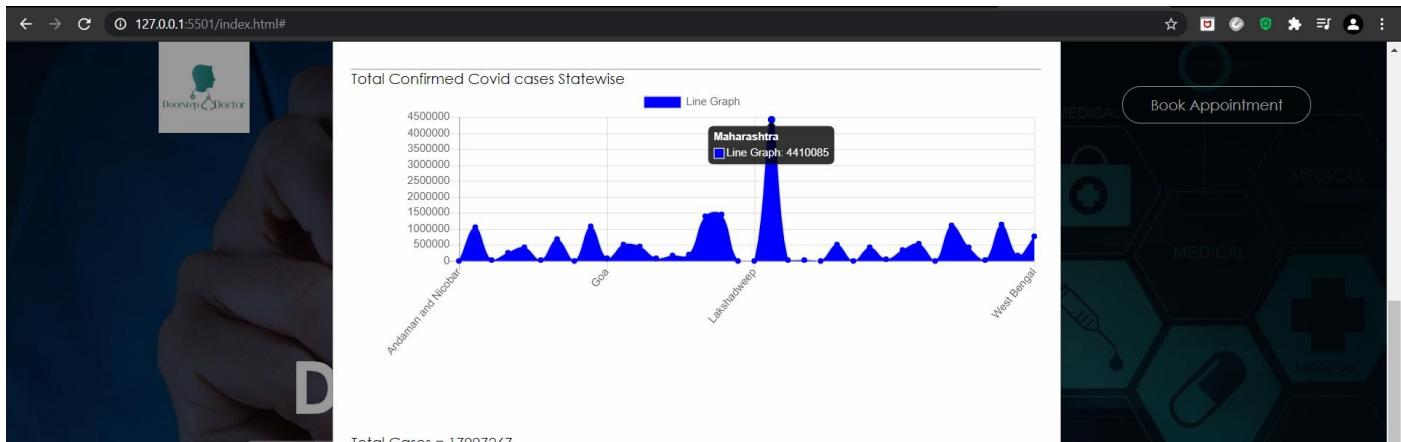

### 9.2.2.2 State-wise Road Accidents in the year 2020:

Conclusion from graphs:

- State/UT with highest number of road accidents in the year 2020 which is Mizoram.
- State/UT with lowest number of road accidents in the year 2020 which is Kerala.

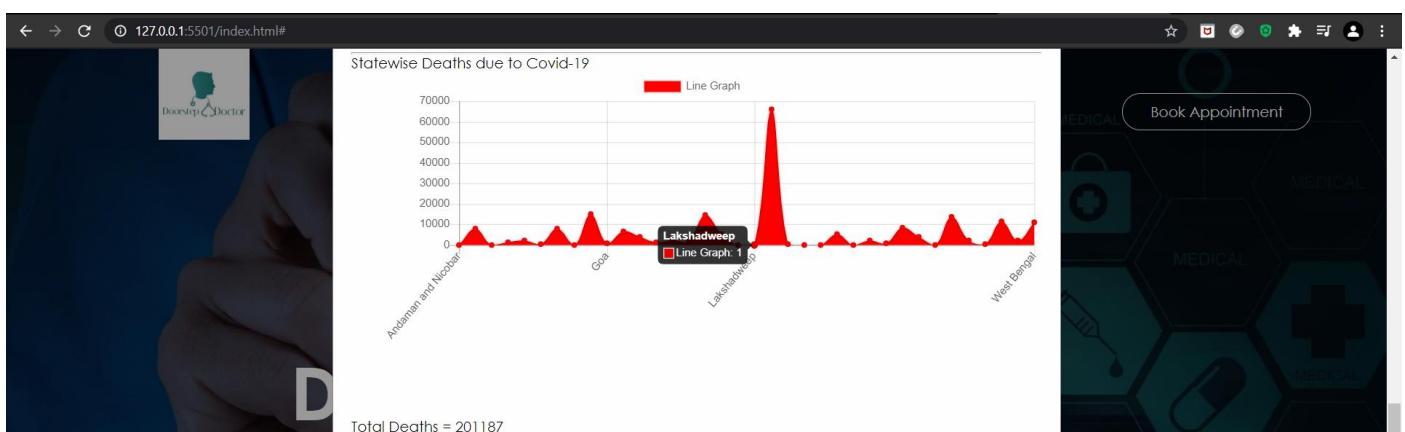

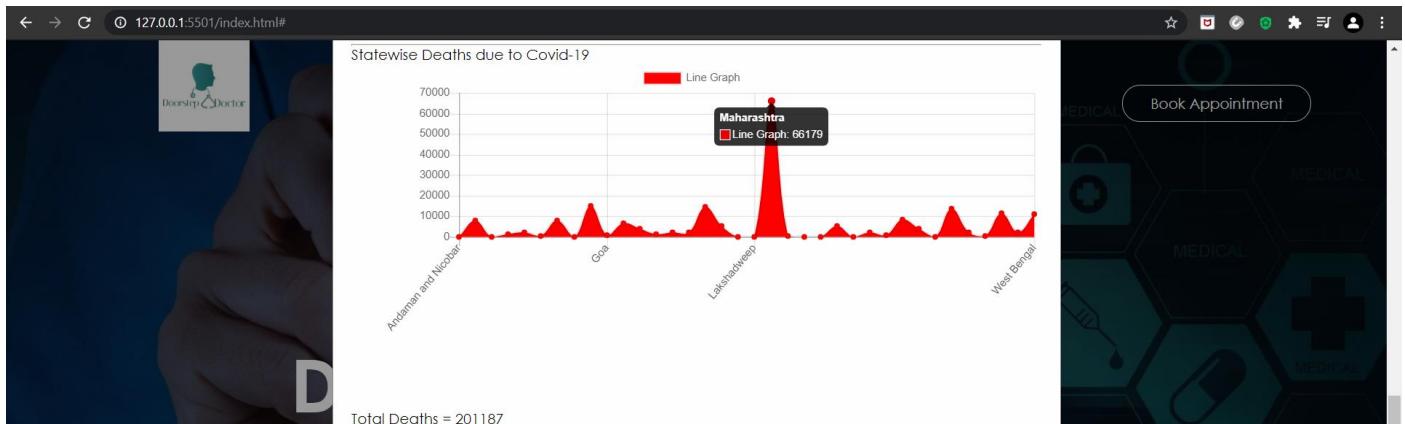

### 9.2.2.3 Total confirmed COVID-19 cases state-wise:

Conclusion from graphs:

- The graph shows total confirmed COVID-19 cases in the country.
- State/UT with highest number of COVID-19 confirmed cases is Maharashtra.
- State/UT with lowest number of COVID-19 confirmed cases is Lakshadweep.

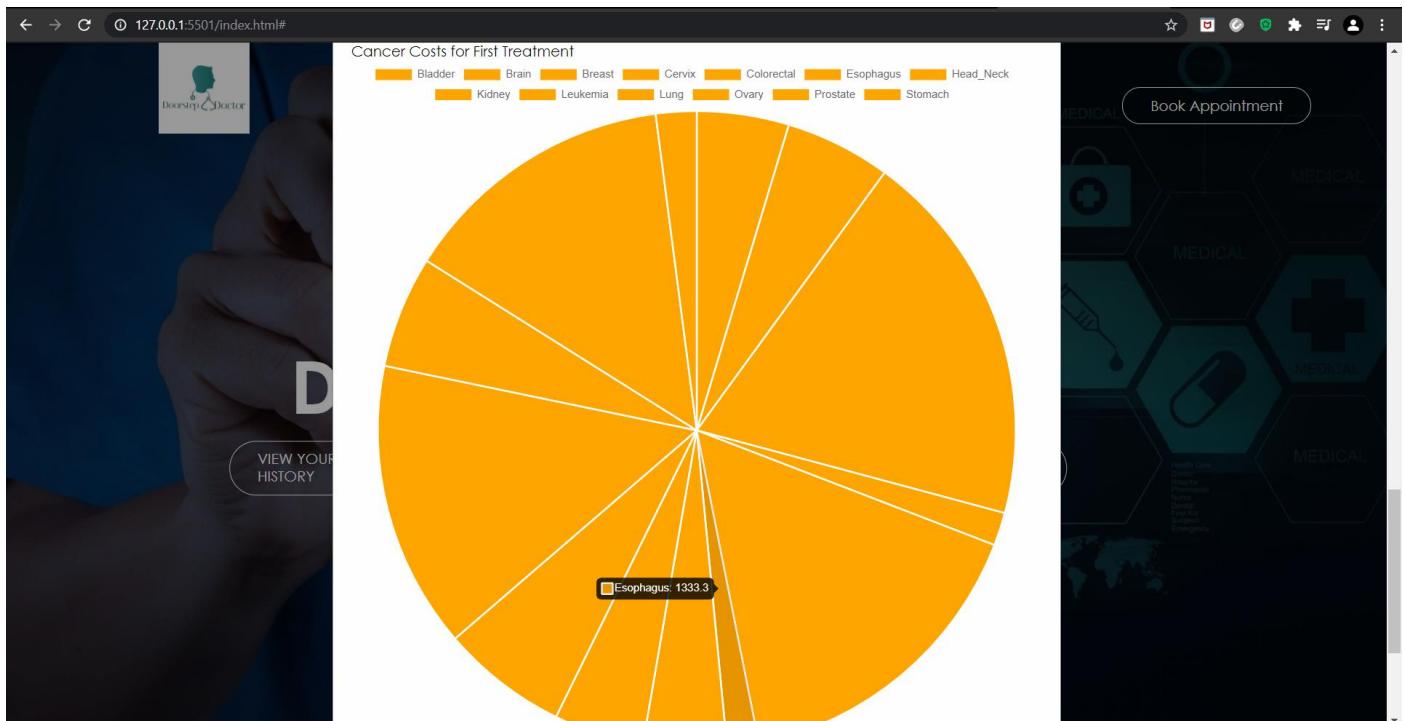

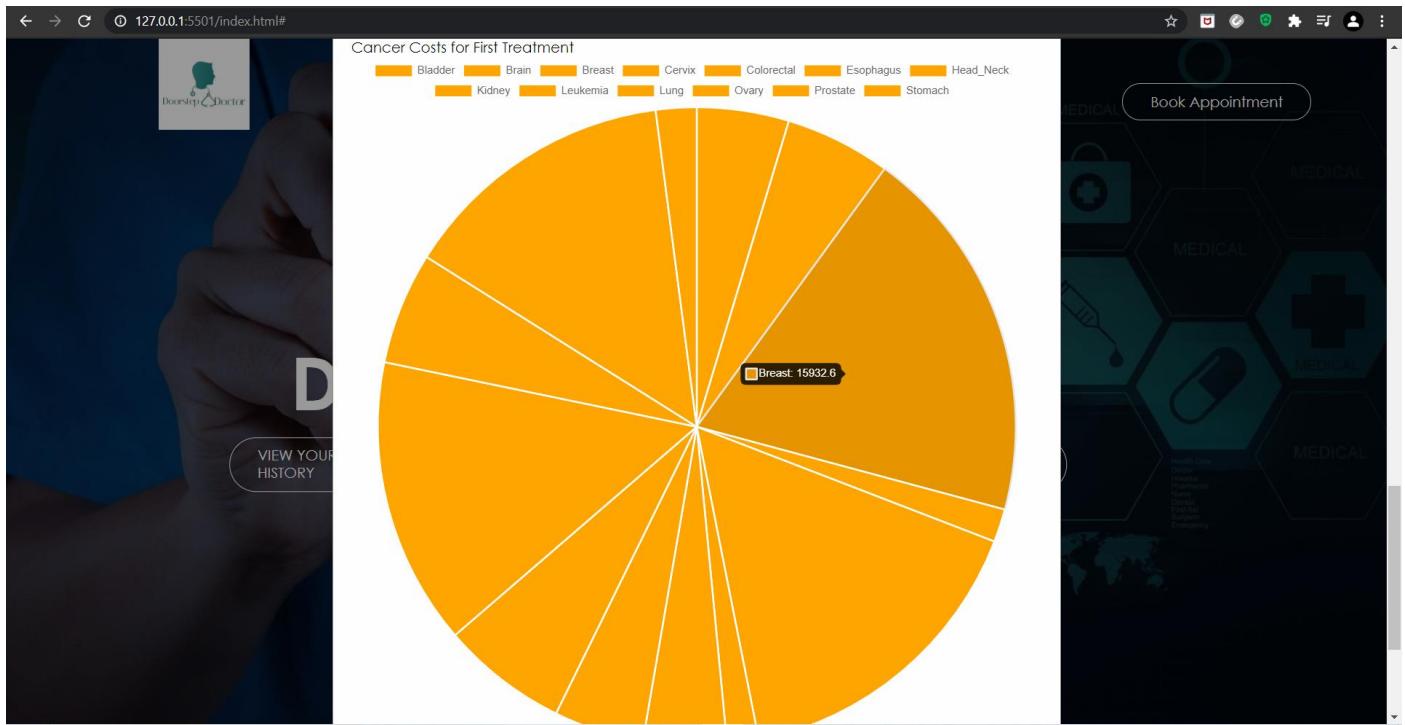

#### 9.2.2.4 State-wise deaths due to COVID-19

Conclusion from graphs:

- The graph shows total COVID-19 deaths in the country.
- State/UT with highest number of COVID-19 deaths is Maharashtra.
- State/UT with lowest number of COVID-19 deaths is Lakshadweep.

### 9.2.2.5 Cancer cost for First Treatment (in US \$):

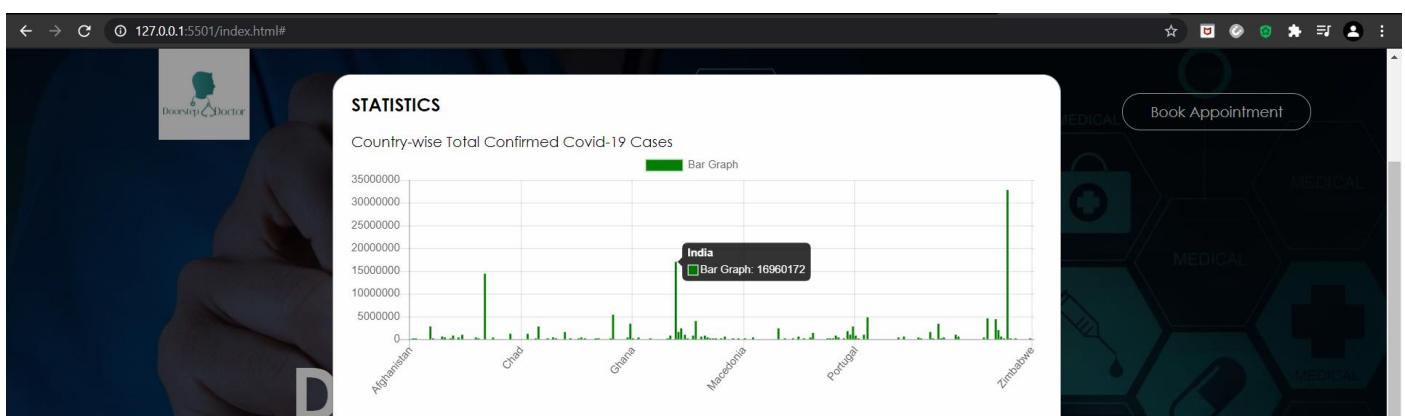

Conclusion from graphs:

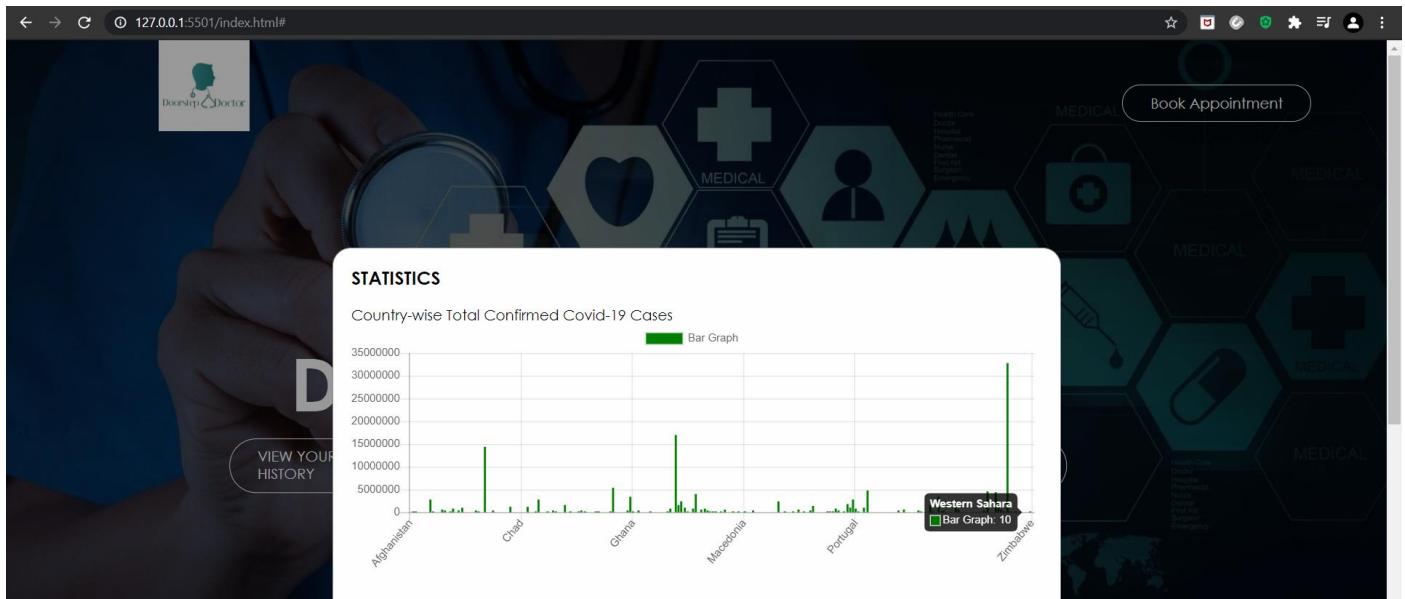

- Cancer with highest cost for First Treatment (in US \$) is Breast Cancer.
- Cancer with lowest cost for First Treatment (in US \$) is Esophagus Cancer.

Under International stats we have plotted 2 graphs related to world-wide data:

### 9.2.2.6 Country-wise Total Confirmed Covid-19 Cases

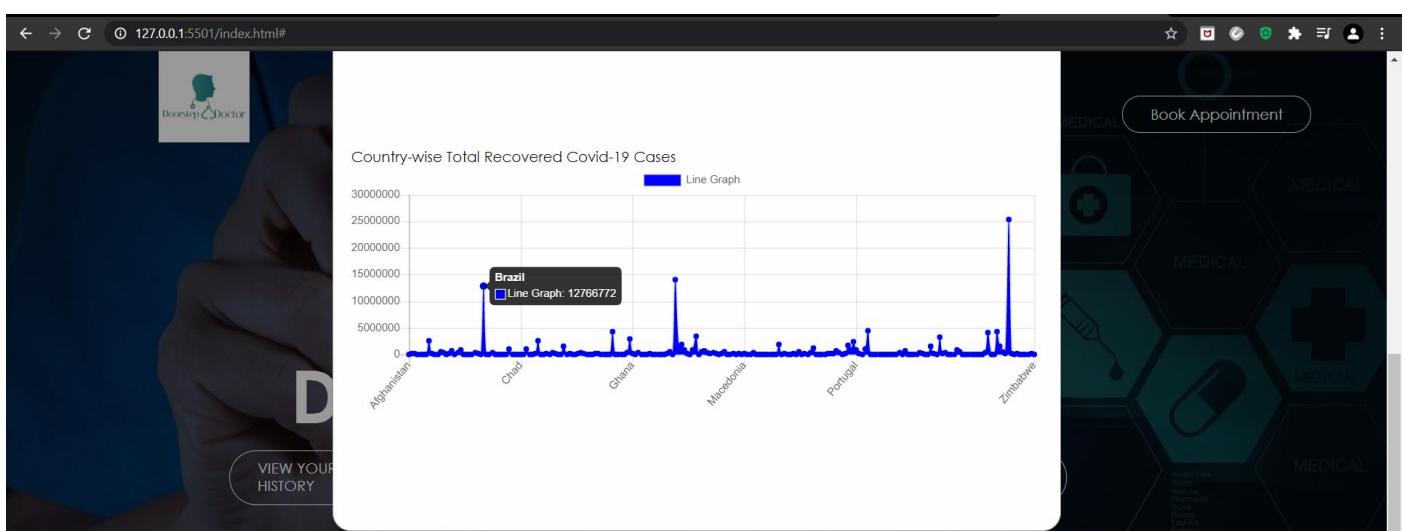

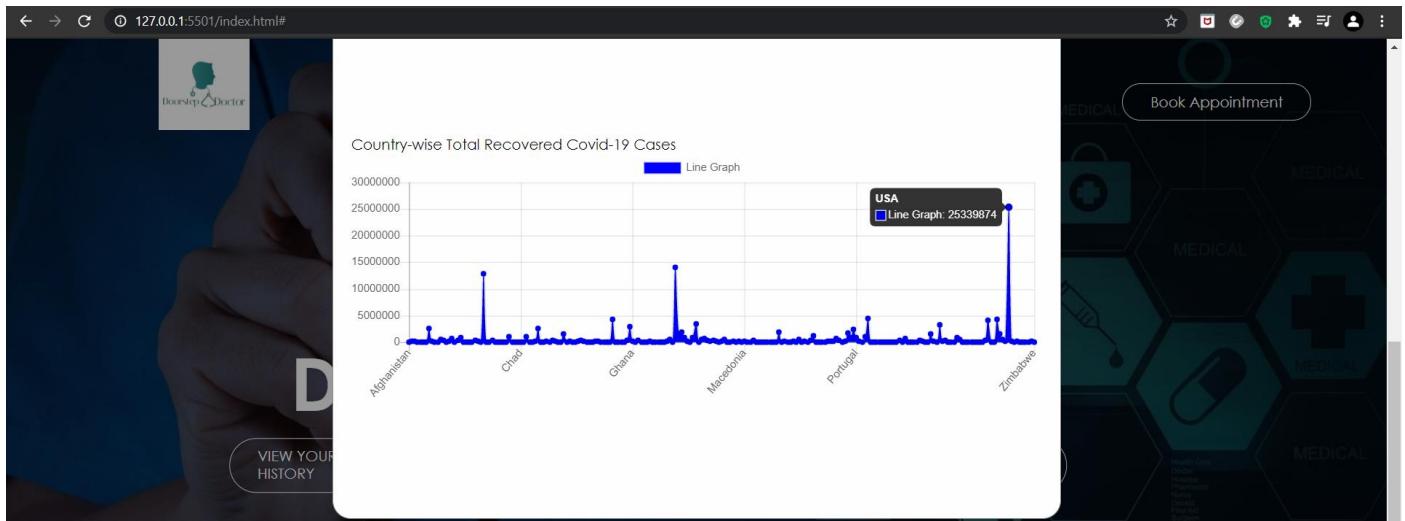

Conclusion from graphs:

- Country with highest number of COVID-19 confirmed cases is USA.
- Country with 2<sup>nd</sup> highest number of COVID-19 confirmed cases is INDIA.
- Country with 3<sup>rd</sup> highest number of COVID-19 confirmed cases is BRAZIL.
- Region with lowest number of COVID-19 confirmed cases is WESTERN SAHARA.

### 9.2.2.7 Country-wise Total Recovered Covid-19 Cases:

Conclusion from graphs:

- Country with highest number of COVID-19 deaths is USA.
- Country with 2<sup>nd</sup> highest number of COVID-19 deaths is INDIA.
- Country with 3<sup>rd</sup> highest number of COVID-19 deaths is BRAZIL.
- Region with lowest number of COVID-19 deaths is WESTERN SAHARA.

## **10. Results**

In this project we were able to develop various modules for hospital management such as patient appointment booking, patient medical history check and so on.

Apart from these we were also able to develop various statistical modules such as analysis of road accidents, bed availability in hospitals, various statistics related to COVID-19 and even cancer treatment costs.

The non-statistical modules were implemented using web and dataset tools such as HTML, CSS, JavaScript, NodeJS, MongoDB and many more.

All the statistical analysis were shown by generating and plotting graphs using some widely used algorithms such as linear regression, logical regression etc. and some visualization libraries such as ChartJS.

Through all these, we were able to develop a system which could analyse various datasets related to healthcare and provide us with real time, accurate and easier to interpret plots and graphs along with the patient management system which could be of great use to the society in the future in healthcare sector.

## **11. Conclusions**

In this project we have comprehensively studied and analysed data from various trusted and reliable sources. We used some popular algorithms to achieve our statistical analysis in the form of graphs and charts.

The graphs were one of the most important results of our project as they clearly depicted the current situation of the world in various fields of the healthcare sector.

Amid this COVID-19 pandemic, we could clearly see the problems arising exponentially in the healthcare sector. Using data analysis, it becomes easier to interpret, understand and improve on the current situation because such plots and charts are easier as well as comfortable to be studied not only by the respective officials but also by the common people.

Very less portion of the healthcare sector has adopted data visualization into their account to work on. It can prove to be very beneficial in the coming future. A lot of work still remains to be done to completely include data analysis and visualization in the healthcare sector, but we are sure that once it is done it will make the healthcare sector reach new heights given its great techniques with better accuracies which have many great applications.

Further studies are required in order to understand why some methods work better or worse than others depending on the datasets and the sectors they are applied to. New techniques with better accuracy and performance trade-offs are expected to be proposed in the forthcoming future.
